Operating Instructions

GOSSEN METRAWATT

PROFITEST MASTER Series

PROFITEST MTECH+, MPRO, MXTRA, MBASE+

IEC 60364-6, EN 50110-1

3-349-647-03
16/2.23

Table of Contents

1 Safety Instructions

Observe this documentation, in particular all included safety information, in order to protect yourself and others from injury, and to prevent damage to the instrument.

The operating instructions and the condensed operating instructions should be made available to all users.

General

- Tests/measurements may only be performed by a qualified electrician, or under the supervision and direction of a qualified electrician. The user must be instructed by a qualified electrician concerning performance and evaluation of tests and/or measurements.
- Observe the five safety rules in accordance with DIN VDE 0105-100:2015-10, VDE 0105-100:2015-10 (EN 50110-1), Operation of electrical installations – Part 100: General requirements
  (1: Shut down entirely. 2: Secure against restart. 3: Assure absence of voltage at all poles. 4: Ground and short circuit. 5: Cover neighboring live components, or make them inaccessible).
- Observe and comply with all safety regulations which are applicable for your work environment.
- Wear suitable and appropriate personal protective equipment (PPE) whenever working with the instrument.
- The functioning of active medical devices (e.g. pacemakers, defibrillators) and passive medical devices may be affected by voltages, currents and electromagnetic fields generated by the tester and the health of their users may be impaired. Implement corresponding protective measures in consultation with the manufacturer of the medical device and your physician. If any potential risk cannot be ruled out, do not use the instrument.

Accessories

- Use only the specified accessories (included in the scope of delivery or listed as options) with the instrument.
- Carefully and completely read and adhere to the product documentation for optional accessories. Retain these documents for future reference.

Handling

- Use the instrument in undamaged condition only.
  Inspect the instrument before use. Pay particular attention to damage, interrupted insulation or kinked cables.
  Damaged components must be replaced immediately.
- Accessories and cables may only be used as long as they’re fully intact.
  Inspect accessories and all cables before use. Pay particular attention to damage, interrupted insulation or kinked cables.
- If the instrument or its accessories don’t function flawlessly, permanently remove the instrument/accessories from operation and secure them against inadvertent use.
- If the instrument or accessories are damaged during use, for example if they’re dropped, permanently remove the instrument/accessories from operation and secure them against inadvertent use.
- The instrument and the accessories may only be used for the tests/measurements described in the documentation for the instrument.
- Neither the integrated voltage measuring function nor the mains connection test may be used to test systems or system components for the absence of voltage.
  Testing for the absence of voltage is only permissible with a suitable voltage tester or voltage measuring system which fulfills the requirements specified in DIN EN 61243.

Operating Conditions

- Do not use the instrument and its accessories after long periods of storage under unfavorable conditions (e.g. humidity, dust or extreme temperature).
- Do not use the instrument and its accessories after extraordinary stressing due to transport.
- The instrument must not be exposed to direct sunlight.
- Only use the instrument and its accessories within the limits of the specified technical data and conditions (ambient conditions, IP protection code, measuring category etc.).
- Do not use the instrument in potentially explosive atmospheres.

Rechargeable Batteries

- When using the charger, only the battery pack (Z502H) may be inserted in the device.
- Do not use the instrument while charging the battery pack (Z502H).
- Do not use the test instrument if the battery compartment lid has been removed.
  Touch contact with dangerous voltage is otherwise possible.
- The battery pack (Z502H) may only be charged in undamaged condition.
  Inspect the battery pack (Z502H) before use. Pay particular attention to leaky and damaged batteries.

Fuses

- The instrument is equipped with fuses. The instrument may only be used as long as the fuses are in flawless condition. Defective fuses must be replaced. See detailed operating instructions.

Measurement Cables and Establishing Contact

- Plugging in the measurement cables must not necessitate any undue force.
- Never touch conductive ends (e.g. of test probes).
- Fully unroll all measurement cables before starting a test/measurement. Never perform a test/measurement with the measurement cable rolled up.
- Avoid short circuits due to incorrectly connected measurement cables.
- Ensure that alligator clips, test probes or Kelvin probes make good contact.

Data Security

- Always create a backup copy of your measurement data.
- Observe and comply with the respectively applicable national data protection regulations. Use the corresponding functions provided by the test instrument such as access protection, as well as other appropriate measures.

2 Applications

Please read this important information!

2.1 Intended Use / Use for Intended Purpose

Measuring and test instruments from the PROFITEST MASTER series include:

- PROFITEST MBASE+ (M520S)
- PROFITEST MXTRA (M520P)
- PROFITEST MTECH+ (M520R)
- PROFITEST MPRO (M520N)

The test instruments are used to test the effectiveness of protective measures at stationary electrical systems in accordance with IEC 60364-6, EN 50110-1 and other country-specific standards. They can also be used for the testing of electric charging stations per EN 61851-1 (DIN VDE 0122-1), and for earth measurements. The test instruments include pre-programmed test sequences for increased working convenience and user-defined test sequences can also be programmed as an option.

The test instruments are especially well suited for testing electrical systems during setup, initial startup, periodic testing and troubleshooting.

The applications range of the test instruments covers all alternating and 3-phase current systems with nominal voltages of 230/ 400 V (300/500 V) and nominal frequencies of 16⅔, 50, 60, 200 and 400 Hz.

A system structure is set up in the test instrument and measured values are assigned to the objects. Completed tests and measured values can be saved and documented in a measurement and test report.

Safety of the operator, as well as that of the test instrument, is only assured when it's used for its intended purpose.

2.2 Use for Other than Intended Purpose

Using the test instrument for any purposes other than those described in these operating instructions, or in the test instrument's condensed operating instructions, is contrary to use for intended purpose.

2.3 Liability and Guarantee

Gossen Metrawatt GmbH assumes no liability for property damage, personal injury or consequential damage resulting from improper or incorrect use of the product, in particular due to failure to observe the product documentation. Furthermore, all guarantee claims are rendered null and void in such cases.

Nor does Gossen Metrawatt GmbH accept any liability for data loss.

2.4 Opening the Instrument / Repairs

In order to ensure flawless, safe operation and to assure that the guarantee isn't rendered null and void, the test instrument may only be opened by authorized, trained personnel. Even original replacement parts may only be installed by authorized, trained personnel.

Unauthorized modification of the test instrument is prohibited.

If it can be ascertained that the test instrument has been opened by unauthorized personnel, no guarantee claims can be honored by the manufacturer with regard to personal safety, measuring accuracy, compliance with applicable safety measures or any consequential damages.

If the guarantee seal is damaged or removed, all guarantee claims are rendered null and void.

2.5 Scope of Functions

PROFITEST … **(Article Number)**	**MBASE+ (M520S)**	**MPRO (M520N)**	**MTECH+ (M520R)**	**MXTRA (M520P)**
Testing of Residual Current Devices (RCDs)				
U_T measurement without tripping the RCD	✓	✓	✓	✓
Tripping time measurement	✓	✓	✓	✓
Measurement of tripping current I_F	✓	✓	✓	✓
Selective, SRCDs, PRCDs, type G/R	✓	✓	✓	✓
AC/DC sensitive RCDs, types B and B+	—	—	✓	✓
Testing of insulation monitoring devices (IMDs)	—	—	—	✓
Testing of residual current monitoring devices (RCMs)	—	—	—	✓
Testing for N-PE reversal	✓	✓	✓	✓
Measurement of Loop Impedance Z_{L-PE} / Z_{L-N}				
Fuse table for systems without RCDs	✓	✓	✓	✓
Without tripping the RCD, fuse table	—	—	✓	✓
15 mA measurement [1]	✓	✓	✓	✓
Earthing resistance R_E (mains operation) I/U measuring method (2/3-wire measuring method via measuring adapter: 2-pole/2-pole + probe)	✓	✓	✓	✓

Documentation of fault simulations at PRCDs with the PROFITEST PRCD adapter	—	—	—	✓
Features				
Selectable user interface language [2]	✓	✓	✓	✓
Memory (database for up to 50,000 objects)	✓	✓	✓	✓
Automatic test sequence function	✓	✓	✓	✓
RS 232 port for RFID/barcode reader	✓	✓	✓	✓
USB port for data transmission	✓	✓	✓	✓
Interface for *Bluetooth*®	—	—	✓	✓
ETC PC database and report generating software	✓	✓	✓	✓
Measuring category: CAT III 600 V / CAT IV 300 V	✓	✓	✓	✓
DAkkS calibration certificate	✓	✓	✓	✓

[1] The so-called live measurement is only advisable if there's no bias current within the system. Only suitable for motor protection switches with small nominal current values.

[2] Currently available languages D, GB, I, F, E, P, NL, S, N, FIN, CZ, PL

3 Documentation

This documentation describes several test instrument.

As a result, features and functions may be described which do not apply to your instrument. Furthermore, illustrations may differ from your instrument.

Note

These operating instructions describe a test instrument with software/firmware version 1.16.20.

List of Abbreviations and their Meanings

RCCBs (residual current circuit breakers / RCDs):

I_{Δ}	Tripping current
$I_{\Delta N}$	Nominal residual current
I_{F}◢	Rising test current (residual current)
PRCD	Portable residual current device PRCD-S: with protective conductor detection and monitoring PRCD-K: with undervoltage trigger and protective conductor monitoring
RCD-S	Selective RCCB
R_E	Calculated earthing or earth electrode loop resistance
SRCD	Socket residual current device (permanently installed)
t_a	Time to trip / breaking time
$U_{I\Delta}$	Touch voltage at moment of tripping
$U_{I\Delta N}$	Touch voltage relative to nominal residual current $I_{\Delta N}$
U_L	Touch voltage limit value

Overcurrent protective devices:

I_{SC}	Calculated short-circuit current (at nominal voltage)
Z_{L-N}	Supply impedance
Z_{L-PE}	Loop impedance

Earthing:

R_B	Operational earth resistance
R_E	Measured earthing resistance
R_{ELoop}	Earth electrode loop resistance

Low-value resistance at
protective, earthing and bonding conductors:

R_{LO+}	Equipotential bonding conductor resistance (+ pole to PE)
R_{LO-}	Equipotential bonding conductor resistance (– pole to PE)

Insulation:

$R_{E(INS)}$	Earth leakage resistance (DIN 51953)
R_{INS}	Insulation resistance
R_{ST}	Standing surface insulation resistance
Z_{ST}	Standing surface insulation impedance

Current:

I_A	Breaking current
I_L	Leakage current (measured with current clamp transformer)
I_M	Measuring current
I_N	Nominal current
I_P	Test current

Voltage:

f	Line voltage frequency
f_N	Nominal voltage rated frequency
ΔU	Voltage drop as %
U	Voltage measured at the test probes during and after insulation measurement R_{INS}
U_{Batt}	(Rechargeable) battery voltage
U_E	Earth electrode voltage
U_{INS}	When measuring R_{INS}: test voltage for ramp function: tripping or breakdown voltage
U_{L-L}	Voltage between two phase conductors
U_{L-N}	Voltage between L and N
U_{L-PE}	Voltage between L and PE
U_N	Nominal line voltage
$U_{3\sim}$	Highest measured voltage during determination of phase sequence
U_{S-PE}	Voltage between probe and PE
U_Y	Phase-to-earth voltage

4 Getting Started

1. Read and adhere to the product documentation. In particular observe all safety information in the documentation, on the instrument and on the packaging.
   See:
   - section 1, “Safety Instructions”, on page 4
   - section 2, “Applications”, on page 5
   - section 3, “Documentation”, on page 6
2. Familiarize yourself with the test instrument.
   See:
   - section 5, “The Instrument”, on page 7
   - section 6, “Operating and Display Elements”, on page 16
   - section 7, “Operation”, on page 26
3. Enter the basic settings.
   See section 8, “Instrument Settings”, on page 27.
4. Optional but recommended: Create a database in the test instrument. See section 9, “Database”, on page 32.
5. Read the basic information provided in section 10, “General Information on Measurements”, on page 37.
6. Perform measurements.
   Refer to individual measurements or test sequences (automatic sequences):
   - section 11, “Measuring Voltage and Frequency”, on page 42
   - section 12, “Testing RCDs”, on page 44
   - section 13, “Testing of Breaking Requirements for Overcurrent Protective Devices, Measurement of Loop Impedance and Determination of Short-Circuit Current (ZL-PE and I_{SC} Functions)”, on page 55
   - section 14, “Measuring Supply Impedance (Z_{L-N} Function)”, on page 58
   - section 15, “Earthing Resistance Measurement (Function R_E)”, on page 60
   - section 16, “Measurement of Insulation Resistance”, on page 74
   - section 17, “Measuring Low-Value Resistance of up to 200 Ω (Protective Conductor and Equipotential Bonding Conductor)”, on page 78
   - section 18, “Measurement with Accessory Sensors”, on page 81
   - section 19, “Special Functions – EXTRA Switch Position”, on page 82
   - section 20, “Test Sequences (Automatic Test Sequences) – AUTO Function”, on page 96

Further interesting information: section 21, “Maintenance”, on page 98.

5 The Instrument

5.1 Scope of Delivery

Standard scope of delivery for PROFITEST MASTER series:

1 Test instrument

1 Earthing contact plug insert, country-specific (PRO-SCHUKO / GTZ3228000R0001)

1 2-pole measuring adapter and cable for expansion into a 3-pole adapter (PRO-A3-II / Z501O)

2 Alligator clips

1 USB cable

1 Neck strap

1 Compact battery pack (Z502H)

1 Charger (Z502R)

1 DAkkS calibration certificate

1 Operating Instructions (this document)

1 ETC software*

** Download from Internet

5.2 Optional Accessories (excerpt)

A complete overview of optional accessories including detailed information can be found in the data sheet for the test instrument.

The most important accessories are listed here:

- Barcode Profiscanner RS232 (Z502F)
(barcode reader and scanner for RS 232 connection to the test instrument for identifying systems, electrical circuits and operating equipment.)
- PRO-HB (Z501V)
Holder for test probes and measuring adapter
- Country-specific plug inserts
  - PRO-GB/USA (Z503B)
  - PRO-CH (GTZ3225000R0001)
- Plug inserts for PE and other similar measurements
  - PRO-RLO-II (Z501P)
(cable length: 10m)
  - PRO-RLO 20 (Z505F)
(cable length: 20m)
  - PRO-RLO 50 (Z505G)
(cable length: 50m)
- PRO-AB (Z502S)
(leakage current measuring adapter for PROFITEST MXTRA)
- PROFITEST PRCD (M512R)
(test adapter for testing portable safety switches (types PRCD-K and PRCD-S) with the help of the PROFITEST MXTRA)
- PROFITEST EMOBILITY (M513R)
(adapter for standards-compliant testing of single and 3-phase, mode 2 and 3 charging cables with simulation of faults)
- E-SET BASIC (Z593A)
(basic earth measurement accessories)
- E-SET PROFESSIONAL (Z592Z)
(extensive earth measurement accessories)

5.3 Meanings of Symbols on the Instrument

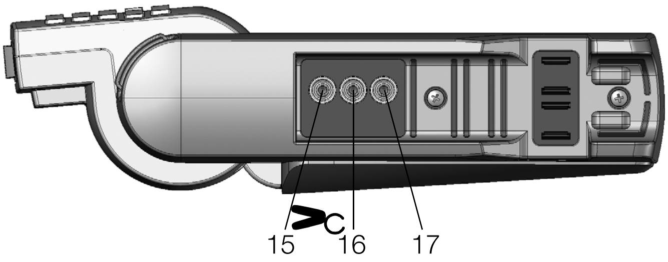
⚠	Warning concerning a point of danger (attention, observe documentation!)
⧈	Protection category II device
	Charging socket for extra-low direct voltage (for Z502R charger)
	The device and its batteries may not be disposed of with household trash. Further information is included in the operating instructions.
CE	Indicates EC conformity
	If the guarantee seal is damaged or removed, all guarantee claims are rendered null and void.
	The special technical knowledge of qualified personnel is required for electrical installation or repair.
	Calibration seal (blue seal): Consecutive number Deutsche Akkreditierungsstelle GmbH – calibration lab Registration number Date of calibration (year – month)
CAT III 600 V CAT IV 300 V	Measuring category

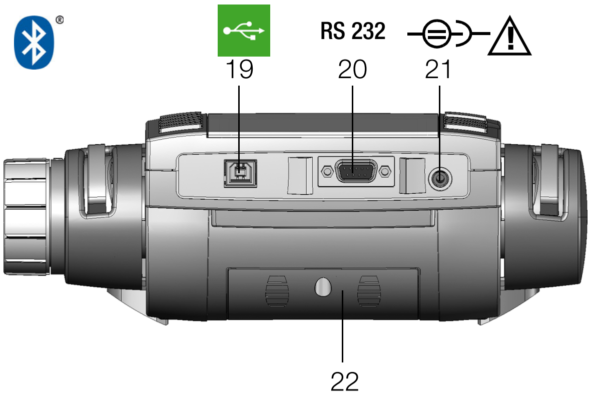
5.4 Instrument Overview

Test Instrument and Adapter

* See section 10.1 on page 37 regarding use of the probes.

Connector Sockets for Current Clamp Sensor, Probe and PRO-AB Leakage Current Measuring Adapter





Test Instrument and Adapter:

1 Control panel with keys and display screen
2 Eyelets for attaching the neck strap
3 Rotary selector switch
4 Measuring adapter (2-pole)
5 Plug insert (country-specific)
6 Test plug (with retaining ring)
7 Alligator clip (plug-on)
8 Test probes
9 **ON/START ▼** key *
10 $I_{\Delta N}$/compens./ZOFFSET key
11 Contact surfaces for finger contact
12 Test plug holder
13 Fuses
14 Holders for test probes (8)

Connections for Current Clamp, Probe, PRO-AB Leakage Current Measuring Adapter:

15 Current clamp connection 1
16 Current clamp connection 2
17 Probe socket

Interfaces, Charger Connection:

18 Bluetooth®
19 USB slave for connection to a PC
20 RS 232 port for connecting barcode or RFID reader
21 Socket for Z502R charger
22 Battery compartment lid (compartment for batteries and spare fuses)

* Can only be switched on with the key on the instrument

Accessories:

A PRO-HB (Z501V) test probe and measuring adapter holder – can be purchased separately

(1) Control Panel – Display Panel

See section 6.1, “Control Panel”, on page 16.

See section 6.2, “Display”, on page 16.

(2) Eyelets for the Neck Strap

The included neck strap can be attached at the right and left hand sides of the instrument. You can hang the instrument from your neck and keep both hands free for measurement.

(3) Rotary Selector Switch

The following basic functions can be selected with the rotary switch:

SETUP / $I_{\Delta N}$ / I_F / $Z_{L\text{-}PE}$ / $Z_{L\text{-}N}$ / R_E / R_{LO} / R_{INS} / U / SENSOR / EXTRA / AUTO

The various basic functions are selected by turning the function selector switch while the instrument is switched on.

(4) Measuring Adapter

Attention!

The measuring adapter (2-pole) may only be used together with the test instrument’s test plug.
Use for other purposes is prohibited!

The plug-on measuring adapter (2-pole) with the two test probes is used for measurements in systems without earthing contact outlets, e.g. at permanent installations, distribution cabinets and all three-phase outlets, as well as for insulation resistance and low-value resistance measurements.

The 2-pole measuring adapter can be expanded to three poles for phase sequence testing with the included measurement cable (test probe).

(5) Plug Insert (country-specific)

Attention!

The plug insert may only be used together with the test instrument’s test plug.
Use for other purposes is prohibited!

After the plug insert has been attached, the instrument can be directly connected to earthing contact outlets. There’s no need to concern yourself with poling at the plug. The instrument detects the positions of phase conductor L and neutral conductor N and automatically reverses polarity if necessary.
The instrument automatically determines whether or not both protective contacts in the earthing contact outlet are connected to one another, as well as to the system protective conductor, for all types of protective conductor measurements when the plug insert is attached to the test plug.

(6) Test Plug

The various country specific plug inserts (e.g. protective contact plug insert for Germany or SEV plug insert for Switzerland) or the measuring adapter (2-pole) are attached to the test plug and secured with a threaded connector.

The controls on the test plug are subject to interference suppression filtering. This may lead to slightly delayed responses as opposed to controls located directly on the instrument.

(7) Alligator Clip (plug-on)

(8) Test Probes

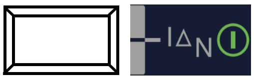
The test probes comprise the second (permanently attached) and third (plug-on) poles of the measuring adapter. A coil cable connects them to the plug-on portion of the measuring adapter.

(9) ON/Start ▼ Key

The measuring sequence for the function selected in the menu is started by pressing this key, either on the test plug or at the control panel. Exception: If the instrument is switched off, it can only be switched on by pressing the key at the control panel.

This key has the same function as the ▼ key on the test plug.

(10) $I_{\Delta N}$ / I Key (at the control panel)



The following sequences are triggered by pressing this key, either on the test plug or at the control panel:

- Starts the tripping test after measurement of touch voltage for RCCB testing ($I_{\Delta N}$).
- Measurement of **ROFFSET** is started in the R_{LO} / $Z_{L\text{-}N}$ function.
- Semiautomatic polarity reversal (see section 10.9)

(11) Contact Surfaces

The contact surfaces are located at both sides of the test plug. When the contact plug is grasped in the hand, contact is automatically made with these surfaces. The contact surfaces are electrically isolated from the terminals and from the measuring circuit.

In the event a potential difference of greater than 25 V between protective conductor terminal PE and the contact surface, PE is displayed. See “LED Indications, Mains Connections and Potential Differences” on page 17.

(12) Test Plug Holder

The test plug with attached plug insert can be reliably secured to the instrument with the rubberized holder.

(13) Fuses

The two fuses protect the device in case of overload. Phase conductor L and neutral conductor N are fused individually. If a fuse is defective, and if an attempt is made to perform a measurement which uses the circuit protected by this fuse, a corresponding message appears at the display panel.

See section 21.2, “Fuse Replacement”, on page 98.

(14) Holders for Test Probes (8)

(15/16) Current Clamp Connector

Only the current clamp transformers offered as accessories may be connected to these sockets.

(17) Probe Connector Socket

The probe connector socket is required for the measurement of probe voltage $U_{S\text{-}PE}$, earth electrode voltage U_E, earthing resistance R_E and standing surface insulation resistance.

It can be used for the measurement of touch voltage during RCD testing. The probe is connected with a 4 mm contact-protected plug.

The instrument determines whether or not the probe has been properly set and displays results at the display panel.

(18) Bluetooth® Port

(19) USB Port

The USB port allows for the exchange of data between the test instrument and a PC.

(20) RS 232 Port

This port allows for data entry by means of a barcode scanner or an RFID reader.

(21) Charging Socket

Only the **Z502R** charger for charging batteries inside the test instrument may be connected to this socket.

(22) Battery Compartment Lid – Replacement Fuses

Attention!

Before removing the lid is removed, the instrument must be disconnected from the measuring circuit at all poles!

The compartment under the lid accommodates the rechargeable battery pack (Z502H), or commercially available rechargeable batteries or regular batteries.

Two replacement fuses are also located under the battery compartment lid.

5.5 Technical Data

Nominal Ranges of Use

Voltage U_N	120 V (108 V … 132 V) 230 V (196 V … 253 V) 400 V (340 V … 440 V)
Frequency f_N	16⅔ Hz (15.4 V … 18 Hz) 50 Hz (49.5 V … 50.5 Hz) 60 Hz (59.4 V … 60.6 Hz) 200 Hz (190 V … 210 Hz) 400 Hz (380 V … 420 Hz)
Overall voltage range	65 V … 550 V
Overall frequency range	15.4 Hz … 420 Hz
Line voltage	Sinusoidal
Temperature range	0 °C … + 40 °C
Battery voltage	8 V … 12 V
Supply impedance angle	Corresponds to cosφ = 1 … 0.95
Probe resistance < 50 kΩ	

Reference Conditions

Line voltage	230 V ± 0.1%
Line frequency	50 Hz ± 0.1%
Measured qty. frequency	45 Hz …65 Hz
Measured qty. waveform	Sine (deviation between effective and rectified value ≤ 0.1%)
Supply impedance angle	cos φ = 1
Probe resistance	≤ 10 Ω
Supply voltage	12 V ± 0.5 V
Ambient temperature	+ 23° C ± 2 K
Relative humidity	40% … 60%
Finger contact	For testing potential difference to ground potential
Standing surface insulation	Purely ohmic

Power Supply

Batteries	8 each AA 1.5 V We recommend exclusive use of the included rechargeable battery pack (2000 mAh, Z502H).
Number of measurements (standard setup with illumination)	
– For R_{INS}	1 measurement – 25 s pause: approx. 1100 measurements
– For R_{LO}	Auto polarity reversal / 1 Ω (1 measuring cycle) – 25 s pause: approx. 1000 (Z502O) measurements
Battery test	Symbolic display of rechargeable battery voltage BAT ▨
Battery-saving circuit	Display illumination can be switched off. The test instrument is switched off automatically after the last key operation. The user can select the desired on-time.
Safety shutdown	If supply voltage is too low, the instrument is switched off, or cannot be switched on.
Recharging socket	Inserted rechargeable batteries can be recharged directly by connecting a charger to the recharging socket: Z502R charger
Charging time	Z502R charger: approx. 2 hours *

---

* Maximum charging time with fully depleted batteries.
A timer in the charger limits charging time to no more than 4 hours.

Overload Capacity

R_{ISO}	1200 V continuous
U_{L-PE}, U_{L-N}	600 V continuous
RCD, R_E, R_F	440 V continuous
Z_{L-PE}, Z_{L-N}	550 V (Limits the number of measurements and pause duration. If overload occurs, the instrument is switched off by means of a thermostatic switch.)
R_{LO}	Electronic protection prevents switching on if interference voltage is present.
Protection with fine-wire fuses	FF 3.15 A 10 s, Fuses blow at > 5 A –

Electrical Safety

Protection class	II
Nominal voltage	230/400 V (300/500 V)
Test voltage	3.7 kV, 50 Hz
Measuring category	CAT III 600 V or CAT IV 300 V
Pollution degree	2
Fuses L and N terminals	1 G fuse-link ea. FF 3.15/500G 6.3 × 32 mm

Electromagnetic Compatibility (EMC)

Product standard EN 61326-1

Interference emission		Class
EN 55022		A
Interference immunity	Test value	Feature
EN 61000-4-2	Contact/atmos. – 4 kV/8 kV	
EN 61000-4-3	10 V/m	
EN 61000-4-4	Mains connection – 2 kV	
EN 61000-4-5	Mains connection – 1 kV	
EN 61000-4-6	Mains connection – 3 V	
EN 61000-4-11	0.5 periods / 100%	

Ambient Conditions

Accuracy	0 … + 40 °C
Operation	−5 … + 50 °C
Storage	−20 … + 60 °C (without batteries)
Relative humidity	Max. 75%, no condensation allowed
Elevation	Max. 2000 m

Mechanical Design

Display	Multiple display with dot matrix, 128 × 128 pixels
Dimensions	W × L × H = 260 × 330 × 90 mm
Weight	Approx. 2.7 kg with batteries
Protection	Housing: IP 40, test probe: IP 20 per EN 60529

Data Interfaces

Type	USB for PC connection
Type	RS 232 for barcode and RFID readers
Type	Bluetooth® (PROFITEST MTECH+/PROFITEST MXTRA only) For PC connection and option for connecting a Bluetooth® keyboard (Bluetooth® Classic) Frequency range: 2400 … 2483.5 MHz Transmission intensity: max. + 3 dBm

5.6 Characteristic Values for PROFITEST MTECH+ and PROFITEST MBASE+

Function	Measured Quantity	Display Range	Resolution	Input Impedance / Test Current	Measuring Range	Nominal Values	Measuring Uncertainty	Intrinsic Uncertainty	Connections

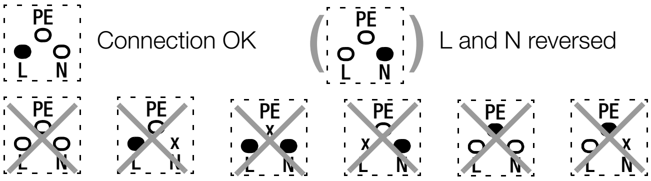
Connection Test – Mains Connection Test (→ section 6.4)



6.3 LEDs

MAINS/NETZ LED

This LED is only functional when the instrument is switched on. It has no function in the voltage ranges U_{L-N} and U_{L-PE}.
It lights up green, red or orange, or blinks green or red depending upon how the instrument has been connected and the selected function (see also section 6.4, "LED Indications, Mains Connections and Potential Differences", beginning on page 17).
This LED also lights up if line voltage is present when measuring R_{ISO} and R_{LO}.

U_L/R_L LED

This LED lights up red if touch voltage is greater than 25 V or 50 V during RCD testing, as well as after safety shutdown occurs. It also lights up if R_{ISO} or R_{LO} limit values have been exceeded or fallen short of.

RCD • FI LED

This LED lights up red if the RCCB is not tripped within 400 ms (1000 ms for selective RCDs – type RCD S) during the tripping test with nominal residual current. It also lights up if the RCCB is not tripped before nominal residual current has been reached during measurement with rising residual current.

⚠ **Attention!**

The mains connection test may not be used to test systems or system components for the absence of voltage!

6.4 LED Indications, Mains Connections and Potential Differences

LED Signals

	Status	Test Plug	Measuring Adapter	Function Switch Position	Function/Meaning
NETZ/ MAINS	Lights up green	X		$I_{\Delta N}$ / I_{F}⊿ , $Z_{L\text{-}N}$ / $Z_{L\text{-}PE}$ / R_E, ΔU, Z_{ST}, kWh, IMD, int. ramp, RCM	Correct connection, measurement enabled
NETZ/ MAINS	Blinks green		X	$I_{\Delta N}$ / I_{F}⊿ , $Z_{L\text{-}N}$ / $Z_{L\text{-}PE}$ / R_E, ΔU, Z_{ST}, kWh, IMD, int. ramp, RCM	N conductor not connected, measurement enabled
NETZ/ MAINS	Blinks red	X	X	$I_{\Delta N}$ / I_{F}⊿ , $Z_{L\text{-}N}$ / $Z_{L\text{-}PE}$ / R_E, ΔU, Z_{ST}, kWh, IMD, int. ramp, RCM	1) No line voltage or 2) PE interrupted
NETZ/ MAINS	Lights up red		X	R_{LO}, R_{ISO}, R_E, I_L, sensor	Interference voltage is present at the test probes. Measurement is disabled.
NETZ/ MAINS	Blinks yellow		X	$I_{\Delta N}$ / I_{F}⊿ , $Z_{L\text{-}N}$ / $Z_{L\text{-}PE}$ / R_E	L and N are connected to the phase conductors.
U_L/R_L	Lights up red	X	X	R_{INS}, R_{LO}, R_E, $Z_{L\text{-}N}$, $Z_{L\text{-}PE}$, ΔU, I_L, U_{res}, sensor	The selected limit value has been violated.
				R_E, $Z_{L\text{-}PE}$, I_{F}⊿, $I_{\Delta N}$, t_a+ΔI, RCM	Interference voltage limit value U_L has been exceeded. → Safety shutdown has occurred.
				$Z_{L\text{-}N}$, $Z_{L\text{-}PE}$, Z_{ST}, IMD, kWh, RCM, PRCD, e-mobility	The test has been manually assessed as "NOT OK".
FI/RCD	Lights up red	X	X	$I_{\Delta N}$ / I_{F}⊿, int. ramp	The RCCB was not tripped, or was tripped too late during the tripping test.

Mains Connection Test — Single-Phase System — LCD Connection Pictographs

---

⚠ **Attention!**

The mains connection test may not be used to test systems or system components for the absence of voltage!

	Status	Test Plug	Measuring Adapter	Function Switch Position	Function/Meaning

Error Messages — LCD Connection Pictographs

	Status	Test Plug	Measuring Adapter	Function Switch Position	Function/Meaning
		X	X	All measurements with protective conductor	Potential difference ≥ U_L between finger contact and PE (earth contact) (frequency f ≥ 50 Hz) Remedy: Check PE connection Note: Only if ☞ is displayed: Measurement can nevertheless be started by pressing the start key again.
		X	X	$I_{\Delta N}$ / I_F◿ Z_{L-N} / Z_{L-PE} / R_E	1) Voltage too high (U > 253 V) for RCD test with direct current 2) U always U > 550 V with 500 mA 3) U > 440 V for $I_{\Delta N}$ / I_F◿ 4) U > 253 V for $I_{\Delta N}$ / I_F◿ with 500 mA 5) U > 253 V for measurement with probe
		X	X	$I_{\Delta N}$	RCD is tripped too early or is defective. Remedy: Test circuit for bias current
		X	X	Z_{L-PE}	RCD is tripped too early or is defective. Remedy: Test with “DC + positive half-wave”.
		X	X	$I_{\Delta N}$ / I_F◿	RCD tripped during touch voltage measurement. Remedy: Check selected nominal test current.

			$R_{LO,}$ IF⊿, $I\Delta_N$, EXTRA → ta+IΔ	The PRCD has been tripped. Reason: Poor contact or defective PRCD
	X	X	All except for U	Externally accessible fuse is blown. The voltage ranges remain functional even if fuses have blown. **Special case, R_{LO}:** Interference voltage during measurement may result in a blown fuse. Remedy: Replace fuse as described in section 21.2.
	X	X	$I_{\Delta N}$ / I_F⊿ $Z_{L\text{-}N}$ / $Z_{L\text{-}PE}$ / R_E	Frequency out of permissible range Remedy: Check the mains connection.
			All	Excessive temperature inside the test instrument Remedy: Wait for test instrument to cool down
	X	X	$_{RINS}$ / RLO	Interference voltage Remedy: Device under test must be disconnected from all sources of voltage
		PRO-RE	RE (bat)	Interference voltage > 20 V at the probes: H to E or S to E No measurement possible
	X	PRO-RE	RE (bat)	Probe ES not connected or connected incorrectly
		PRO-RE/ 2	RE (bat)	Generator current clamp (E-Clip-2) not connected
	X	X	All measurements with probe	Interference voltage at the probe
	X	X	R_{ISO}	Overvoltage or overloading of the measuring voltage generator during measurement of R_{INS} Remedy: Ensure absence of voltage at the device under test.
	X	X	$I_{\Delta N}$ / I_F⊿ $Z_{L\text{-}N}$ / $Z_{L\text{-}PE}$ Z_{ST}, R_{ST}, R_E Meter startup	No mains connection Remedy: Check the mains connection.
	X	X	All	Defective hardware Remedy: 1) Switch on/off or 2) Briefly remove the batteries. If error message persists, send instrument to GMC-I Service GmbH.
	X	X	R_{LO}	OFFSET measurement is not sensible. Remedy: Check system. OFFSET measurement of **R**LO+ and **R**LO– is still possible.
		X	R_{LO}	R_{OFFSET} > 9.99 Ω: OFFSET measurement is not sensible. Remedy: Check system.
		X	EXTRA → ΔU	Z > 9.99 Ω: OFFSET measurement is not sensible. Remedy: Check system.

<table>
<tr><td> </td><td></td><td>X</td><td>EXTRA → ΔU</td><td>$\Delta U_{OFFSET} > \Delta U$:
OFFSET value is greater than the measured value at the consuming system.
OFFSET measurement is not sensible.
Remedy: Check system.</td></tr>
<tr><td> </td><td>X</td><td>X</td><td>R_{ISO} / R_{LO} / $R_{E(bat)}$</td><td>Contact problem or blown fuse
Remedy: Check test plug or measuring adapter for correct seating in the test plug, or replace the fuse.</td></tr>
<tr><td> </td><td></td><td>X</td><td>R_E</td><td>The polarity of the 2-pole adapter must be reversed.</td></tr>
<tr><td> </td><td>X</td><td></td><td>$I_{\Delta N}$ / I_F ⊿</td><td>N and PE are reversed.</td></tr>
<tr><td> </td><td>X</td><td>X</td><td>$I_{\Delta N}$ / I_F ⊿
Z_{L-N} / Z_{L-PE} / R_E</td><td>1) Mains connection error
Remedy: Check the mains connection.
or
2) Display at the connection pictograph: PE interrupted (x) or bottom protective conductor bar interrupted with reference to the keys at the test plug
Cause: Voltage measuring path interrupted
Result: Measurement is disabled
Note: Only if ☞ is displayed: Measurement can nevertheless be started by pressing the start key again.</td></tr>
<tr><td> </td><td>X</td><td></td><td>$I_{\Delta N}$ / I_F ⊿</td><td>Display at the connection pictograph:
Top protective conductor bar interrupted with reference to the keys at the test plug
Cause: Current measuring path interrupted
Result: No measured value display</td></tr>
<tr><td> </td><td></td><td></td><td>R_E
$I_{\Delta N}$ / I_F ⊿</td><td>Probe is not detected, probe not connected
Remedy: Check probe connection.</td></tr>
<tr><td> </td><td></td><td></td><td>R_E</td><td>Clamp is not detected:
– Clamp is not connected or
– Current through clamp is too small (partial earthing resistance too high) or
– Transformation ratio set incorrectly
Remedy: Check clamp connection and transformation ratio.
Check the batteries in the METRAFLEX P300 and replace if necessary.</td></tr>
<tr><td> </td><td></td><td></td><td>R_E</td><td>If you have changed the transformation ratio at the test instrument, a message appears prompting you to change the setting at the current clamp sensor as well.</td></tr>
<tr><td> </td><td></td><td></td><td>R_E</td><td>Voltage too high at clamp input or signal distorted
The transformation ratio parameter selected at the test instrument might not correspond to the transformation ratio at the current clamp sensor.
Remedy: Check transformation ratio or test setup.</td></tr>
<tr><td></td><td></td><td></td><td>All</td><td>Battery voltage is less than or equal to 8 V.
Reliable measurement is no longer possible.
Storage of measured values to memory is disabled.
Remedy: Rechargeable batteries must be recharged or replaced towards the end of their service life.</td></tr>
<tr><td> </td><td></td><td></td><td>$I_{\Delta N}$ / I_F ⊿</td><td>Resistance in N-PE path is too high.
<table>
<tr><td></td><td colspan="5">$I_{\Delta N}$/I_F</td></tr>

</table>
Consequence: The required test current cannot be generated and measurement is aborted.</td></tr>
</table>

			$Z_{L\text{-}PE}$, R_E	If specified touch voltage U_L is exceeded: $Z_{L\text{-}PE}$ and R_E: User is prompted to switch to the 15 mA wave. R_E alternative only: User is prompted to reduce the measuring range (reduce current.)

Entry Plausibility Check – Parameters Combination Checking — LCD Pictographs

	Status	Test Plug	Measuring Adapter	Function Switch Position	Function/Meaning
					Parameter out of range
				$I_{\Delta N}$	5 × 500 mA is not possible
				$I_{\Delta N}$ / I_F⊿ EXTRA → ta + IΔ	Types B, B+ and EV/MI not possible with G/R, SRCD, PRCD
				$>I_{\Delta N}$	180° not possible for RCD-S, G/R, SRCD, PRCD-S, PRCD-K
				$I_{\Delta N}$ / I_F⊿	DC not possible with G/R, SRCD, PRCD
				$I_{\Delta N}$ / I_F⊿	Half-wave or DC not possible with type AC
				$I_{\Delta N}$ / I_F⊿ EXTRA → RCM	DC not possible with type A, F
				$I_{\Delta N}$ EXTRA → RCM	½ test current not possible with DC
				$I_{\Delta N}$	2 × $I_{\Delta N}$ / 5 × $I_{\Delta N}$ with full-wave only
				R_E	DC+ with 10 Ω only
				R_E	No DC bias in the IT network
				R_E	15 mA only possible in 1 kΩ and 100 Ω ranges!

				EXTRA → RCM	With RCM: Types AC, F, B+ and EV/MI are not possible.
				$I_{\Delta N}$ / I_F ⊿ EXTRA → RCM	Measurement with half-wave or DC is not possible in IT systems.
				All	The parameters you have selected do not make sense in combination with previously configured parameters. The selected parameter settings will not be saved. Remedy: Enter other parameters.
				R_E	2-pole measurement via earthing contact plug is not possible in IT systems.
				EXTRA → ta+IΔ	The intelligent ramp is not possible with RCD types RCD-S and G/R.

Messages — LCD Pictographs — Test Sequences

	Status	Test Plug	Measuring Adapter	Function Switch Position	Function/Meaning
Sequence ?				AUTO	The test sequence includes a measurement which cannot be processed by the connected test instrument. The corresponding test step must be skipped. Example: The test sequence includes an RCM measurement which has been sent to the PROFITEST MTECH+.
Sequence finished				AUTO	The test sequence has been run successfully.
NO DATA				AUTO	No test sequences have been saved. Cause: These may have been deleted as a result of any of the following actions: changing the language, the profile or the DB mode, or resetting the test instrument to its default settings.

Error Messages — LCD Pictographs — PRO-AB Leakage Current Measuring Adapter

	Status	Test Plug	Measuring Adapter	Function Switch Position	Function/Meaning
				EXTRA → I_L	Measuring range exceeded Change to the larger measuring range (test instrument and leakage current measuring adapter).
				EXTRA → I_L	Test measurement: The test has been passed. The leakage current measuring adapter is now ready for use.
				EXTRA → I_L	Test measurement: The test has not been passed. The leakage current measuring adapter is defective. Contact our repair service department.
				EXTRA → I_L	Test measurement: Check the fuse in the leakage current measuring adapter.

 The measuring parameters differ from the object data Do you wish to adapt the database?			$I_{\Delta N}$ / I_F⊿ Z_{L-N} / Z_{L-PE} EXTRA → t_A+I_Δ EXTRA → RCM	**Measured Value Storage with Deviating Electrical Circuit Parameter** The electrical circuit parameter selected by yourself at the test instrument does **not** coincide with the parameter entered under object data in the structure. **Example:** Residual operating current is specified as 10 mA in the database, but you have performed measurement with 100 mA. If you want to perform all future measurements with 100 mA, the value in the database has to be changed by acknowledging with the ☑ key. The measured value is documented and the new parameter is accepted. If you want to leave the parameter in the database unchanged, press the ✗ key. The measured value and the changed parameter are only documented in this case.
 TXT = ? Abc...123 !			All	Please enter a designation (alphanumeric).
 0% !			All	Operation with a Barcode Scanner Error message when the “EDIT” entry field is opened and rechargeable battery voltage is less than 8 V. Output voltage is generally switched off during barcode scanner operation if U is less than 8 V in order to assure that remaining battery capacity is adequate for entering designations for devices under test and saving the measurement. Remedy: Rechargeable batteries must be recharged or replaced towards the end of their service life.
 			All	Operation with a Barcode Scanner Current flowing through the RS 232 port is too high. Remedy: The connected device is not suitable for this port.
 CODE ?			All	Operation with a Barcode Scanner Barcode not recognized, incorrect syntax.
 			All	Data cannot be entered at this location within the structure. Remedy: Observe profile for preselected PC software (see **SETUP** menu in section 8).
 			All	Measured value cannot be saved at this location within the structure. Remedy: Make sure that you have selected the right profile for you PC evaluation program in the **SETUP** menu (see section 8).
 MEM ! 100% !			All	Memory is full. Remedy: Save your measurement data to a PC and then clear memory at the test instrument by deleting the database or by importing an empty database.
 Delete? YES NO			All	Delete measurement or database elements. This prompt window asks you to confirm deletion (YES).
 Delete all data? YES NO			SETUP	⚠ **Attention!** **Data loss after restoring default settings!** Back up your measurement data to a PC before pressing the respective key. This prompt window asks you to confirm deletion.

7 Operation

Attention!

The protective foil on the two sensor surfaces (finger contacts) of the test plug must be removed to ensure reliable detection of touch voltages.

7.1 Power Supply

The instrument is powered by rechargeable batteries. The included Master Battery Pack (Z502H) or commercially available individual rechargeable or regular batteries can be used.

Note

If at all possible use the included battery pack (Z502H) with sealed cells. This ensures that the complete set of rechargeable batteries is always replaced at the same time and that all batteries are inserted with correct polarity, in order to assure that they do not fail.

The included Z502H battery pack has already been inserted during initial startup (see condensed operating instructions).

7.1.1 Inserting or Replacing the Battery Pack (Z502H) or Commercially Available Individual (Rechargeable) Batteries

Attention!

Before opening the battery compartment, disconnect the instrument from the measuring circuit (mains) at all poles!

Attention!

Commercially available, individual rechargeable or regular batteries must comply with the technical data (see page 10).

- ➭ Loosen the slotted screw for the rechargeable battery compartment lid on the back and remove the lid.
- ➭ Remove the depleted battery pack or commercially available rechargeable or regular batteries.
- ➭ Insert the battery pack or commercially available rechargeable or regular batteries into the battery compartment.

Attention!

In the case of commercially available, individual rechargeable or regular batteries: make sure that all of the batteries are inserted with correct polarity. If just one battery is inserted with reversed polarity, it will not be recognized by the instrument and may result in leakage from the batteries and damage to the instrument.

- ➭ Replace the lid and retighten the screw.

Note

Dispose of the battery pack or commercially available, individual rechargeable or regular batteries in an environmentally sound fashion when their service life has nearly expired (approx. 80% charging capacity). See section 24, “Disposal and Environmental Protection”, on page 101.

7.1.2 Charging the Battery Pack (Z502H) in the Tester

Attention!

If commercially available, individual rechargeable batteries are used, they must be charged externally. Do not use the Z502R charger to charge commercially available individual batteries. The quality of commercially available, individual rechargeable batteries cannot be checked and may result in overheating and thus deformation and explosion when charging them in the instrument.

Attention!

If commercially available, individual rechargeable batteries are used, they must be charged externally. Do not use the Z502R charger to charge commercially available individual batteries.
The quality of commercially available, individual rechargeable batteries cannot be checked and may result in overheating and thus deformation and explosion when charging them in the instrument.

Attention!

Regular batteries may not be charged.

Attention!

Use only the Z502R charger in order to recharge the Compact Battery Pack (Z502H) in the test instrument.

Attention!

The Z502R charger is suitable for mains operation only!

Attention!

Do not switch the test instrument on during charging. The charging process may otherwise be impaired.

- ➭ Verify that the battery pack (Z502H) is inserted, i.e. that commercially available battery packs or batteries are not inserted.
- ➭ Insert the correct mains plug for your country into the charger Z502R.
- ➭ Connect the Z502R charger to the test instrument with the jack plug, and then to the 230 V mains with the interchangeable plug.
- ➭ Do not disconnect the charger from the test instrument until the green LED (charged/ready) lights up.

If the rechargeable batteries or battery pack have not been used or recharged for a lengthy period of time (> 1 month), thus resulting in excessive depletion:

Observe the charging sequence (indicated by LEDs at the charger) and initiate a second charging sequence if necessary (disconnect the charger from the mains and from the test instrument to this end, and then reconnect it).

Please note that the system clock stops in this case and must be set to the correct time after the instrument has been restarted.

7.2 Switching the Instrument On/Off

The test instrument is switched on by pressing the **ON/START▼** key. The menu which corresponds to the momentary selector switch position is displayed.

The instrument can be switched off manually by simultaneously pressing the **MEM** and **HELP** keys.

After the period of time selected in the **SETUP** menu has elapsed, the instrument is switched off automatically (see “Device Settings”, section 8).

Battery Test

A battery test is performed after switching the instrument on.

If supply voltage has fallen below the permissible lower limit, the pictograph shown at the right appears. “Low Batt!!!” is also displayed along with an icon.

BAT

The instrument does not function if the batteries have been depleted excessively, and no display appears.

Ensure adequate power supply by charging the rechargeable battery pack (Z502H/) or by inserting fully charged, commercially available rechargeable batteries or new batteries. See section 7.1, “Power Supply”, on page 26.

Significance of Individual Parameters

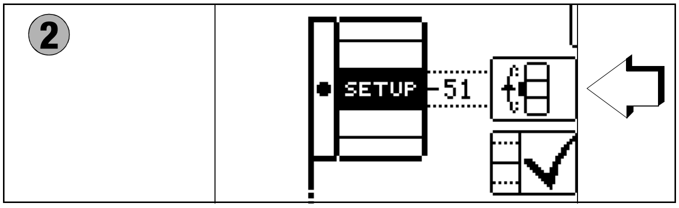
0a Test Instrument On-Time

The period of time after which the test instrument is automatically shut off can be selected here. This selection has a considerable influence on the service life and the charging status of the batteries.

0b LCD Illumination On-Time

The period of time after which LCD illumination is automatically shut off can be selected here. This selection has a considerable influence on the service life and the charging status of the batteries.

2 Submenu: Rotary Switch Balancing



Proceed as follows in order to precision adjust the rotary switch:

1 Press the **TESTS** Rotary Switch / Battery Test softkey in order to access the rotary switch balancing menu.

2 Then press the softkey with the rotary switch icon.

3 Make sure that the rotary switch is set to **SETUP**.
The level mark to the left of the number should be aligned to the black function field with the respective rotary switch designation. The value of the number can be displayed within a range of -1 to 101 and should be between 45 and 55. In the case of -1 or 101, the rotary switch position does not match the measuring function shown at the display.
If the displayed value is not within this range, readjust the position by pressing the **readjust** softkey ✓. A brief acoustic signal acknowledges readjustment.

Note

If labeling in the LCD image of the rotary switch does not correspond with its actual position, a continuous acoustic signal is generated as a warning when the **readjust** softkey ✓ is pressed.

---

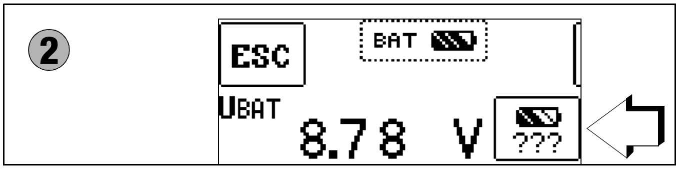
4 Acknowledge by pressing the softkey with the rotary switch icon. The display is then switched to the next measuring function.

5 Turn the rotary switch clockwise to the next measuring function (after **SETUP** comes $I_{\Delta N}$).

6 Repeat steps 3 through 5 until all rotary switch functions have been tested, and if necessary readjusted.

7 Press **ESC**, in order to return to the main menu.

2 Submenu: Battery Level Query

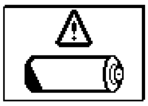


UBAT 8.78 V

If battery voltage has dropped to 8.0 V or less, the **UL/RL LED** lights up red and an acoustic signal is generated as well.

Note

Measuring Procedure



If battery voltage drops to below 8.0 V during the course of a measuring sequence, this is only indicated by means of a pop-up window. Measured values are invalid. The measurement results cannot be saved to memory.

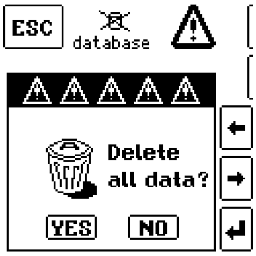
➩ Press **ESC** in order to return to the main menu.

3c User Interface Language (CULTURE)

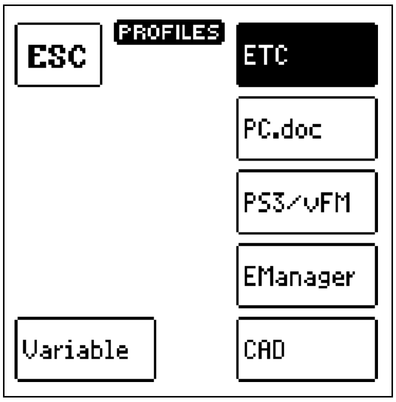
➩ Select the desired country setup with the appropriate country code.

Attention!

All structures, data and sequences are deleted when the language is changed!
Back up your structures, measurement data and sequences to a PC before pressing the key.
The prompt window shown at the right asks you to confirm deletion.



3d Profiles for Distributor Structures (PROFILES)



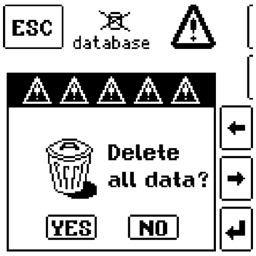
The profiles are laid out in a tree structure. The tree structure for the utilized PC evaluation program may differ from that of the PROFITEST MASTER. For this reason, the PROFITEST MASTER provides the user with the opportunity of adapting this structure.

Selecting a suitable profile determines which object combinations are made possible. For example, this makes it possible to create a distributor which is subordinate to another or to save a measurement to a given building.

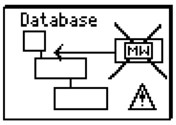
➩ Select the PC evaluation program you intend to use.

Attention!

All structures, data and sequences are deleted when the profile is changed!
Back up your structures, measurement data and sequences to a PC before pressing the key.
The prompt window shown at the right asks you to confirm deletion.



If you haven't selected a suitable PC evaluation program and, for example, if measured value storage to the selected location within the structure is not possible, the pop-up window shown at the right appears.



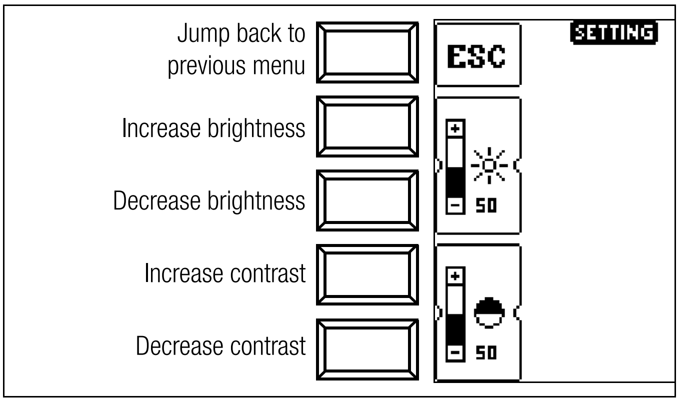
3e Default Settings (GOME SETTING)

The test instrument is returned to its original default settings when this key is activated.

Attention!

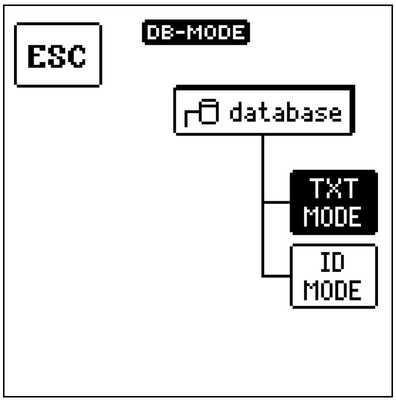
All structures, data and sequences are deleted!
Back up your structures, measurement data and sequences to a PC before resetting.

3f Adjusting Brightness and Contrast



3g DB-MODE – Display of the Database in the Text or ID Mode

DB MODE functionality is available as of test instrument firmware version 01.05.00 and as of ETC version 01.31.00.



Creating Structures in the TXT MODE

The database in the test instrument is set to the text mode as a default feature and “TXT” appears in the header. You can create structure elements in the test instrument and label them in plain text, e.g. Customer XY, Distributor XY and Circuit XY.

Creating Structures in the ID MODE

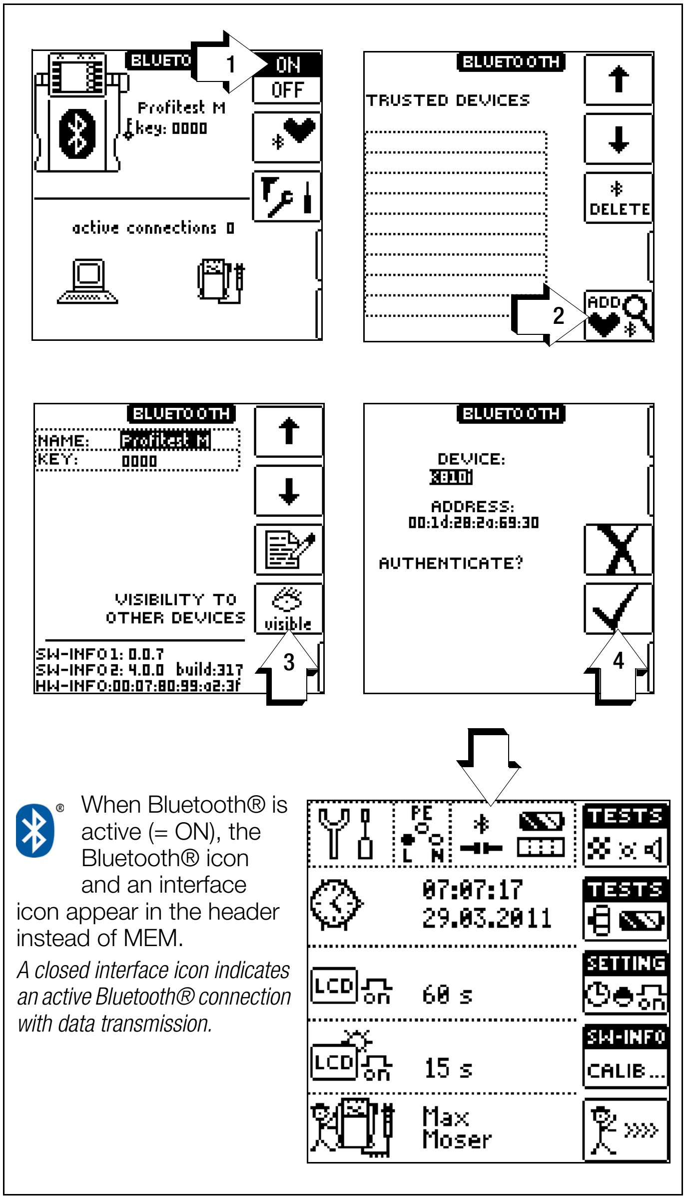
You can work in the ID MODE as an alternative, in which case “ID” appears in the header. You can create structure elements in the test instrument and label them with any desired ID numbers.

☞ **Note**

Structures can be created in the test instrument in either the text mode or the ID mode.
In contrast to this, designations and ID numbers are always assigned in the report generating program.

If no texts or ID numbers have been entered to the test instrument when creating structures, the report generating program creates the missing entries automatically. These can then be edited in the report generating program and transferred back to the test instrument if required.

3h Switching Bluetooth® On/Off (PROFITEST MTECH+/PROFITEST MXTRA only)



When Bluetooth® is active (= ON), the Bluetooth® icon and an interface icon appear in the header instead of MEM.

A closed interface icon indicates an active Bluetooth® connection with data transmission.

A Bluetooth® keyboard can be connected via the Bluetooth® interface.

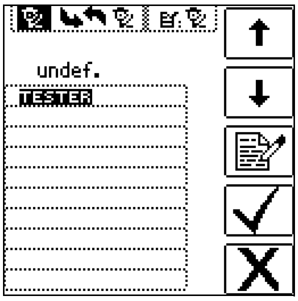
☞ **Note**

Only Bluetooth® Classic keyboards (also known as Bluetooth Basic Rate / Enhanced Data Rate – BR/EDR) are supported.
Bluetooth® Low Energy keyboards (also known as Bluetooth® Niedrigenergie – LE) are not supported.

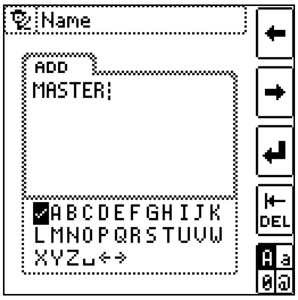
Tested and approved keyboards: Logitech K380, Keychron K3

We are unable to offer any guarantees for use with other devices.

④ Selecting, Adding or Deleting an Inspector



Add a new inspector



Select letter/character

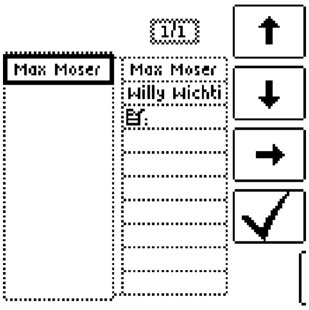
Select letter/character

Accept letter/character
Accept name

Delete letter/character

Toggle: upper/lowercase,
vowel mutations & special chars.

See also section 10.8 on page 40 regarding the entry of a text.



Select inspector

Select inspector

Accept inspector

(delete inspector via ETC only)

☞ **Note**

The inspector cannot be changed. If an inspector's name is incorrect, it can be deleted and a new inspector can be created with the correct name.
Changes are not retroactive. Deleted inspectors are retained for tests which have already been performed.

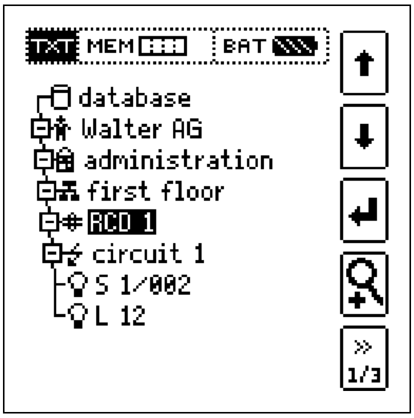
9 Database

9.1 Creating Distributor Structures, General

A complete distributor structure with data for electrical circuits and RCDs can be created in the test instrument.
This structure makes it possible to assign measurements to the electrical circuits of various distributors, buildings and customers.

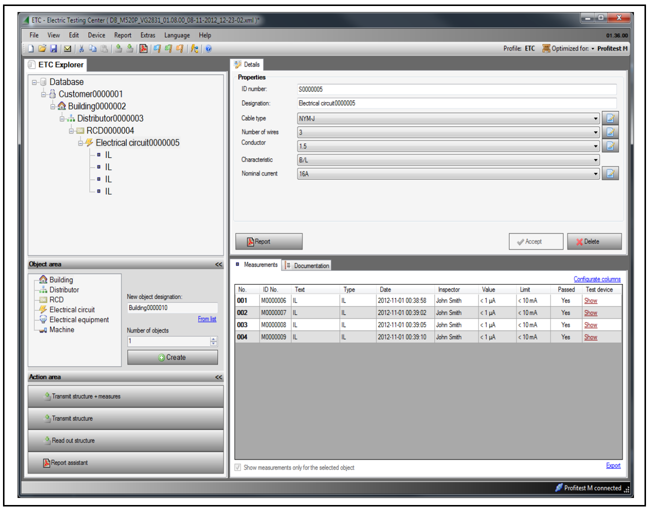
There are two possible procedures:

- On location or at the construction site: create a distributor structure in the test instrument.
  A distributor structure with up to 50,000 structure elements can be created in the test instrument, which is saved to the instrument's flash memory.



or

- Create and save an image of an existing distributor structure at a PC with the help of **ETC** report generating software (Electric Testing Center) – see Help > Getting Started (F1). The distributor structure is then transferred to the test instrument.



Notes regarding ETC

The following steps must be completed before using the software:

- Install the USB device driver
  (required for operation of the test instrument at a PC):
  GMC-I Driver Control software for installing the USB device driver can be downloaded from our website:
  https://www.gmc-instruments.de/services/download-center/
- Install ETC report generating software:
  The most up-to-date version of ETC can be downloaded free of charge from the mygmc page of our website as a ZIP file, if you have registered your test instrument:
  https://www.gmc-instruments.de/services/mygmc/

9.2 Transferring Distributor Structures

The following data transfer operations are possible:

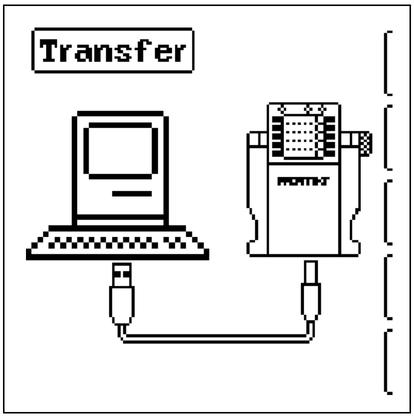
- Transfer a distributor structure from the PC to the test instrument.
- Transfer a distributor structure including measured values from the test instrument to the PC.

The test instrument and the PC must be connected with a USB cable in order to transfer structures and data.

Note

The rotary selector switch may not be set to the "U" position during data transmission.

The following image appears at the display during transfer of structures and data.



9.3 Creating a Distributor Structure in the Test Instrument

Overview of the Meanings of Icons used to Create Structures

Icons		Meaning
Main level	Sublevel	
		Memory Menu, Page 1 of 3
⬆		Cursor UP: scroll up
⬇		Cursor DOWN: scroll down
↵	⊞ ⊟	ENTER: Acknowledge selection. + → – change to sub-level (expand directory) or – → + change to main level (close directory)
🔍+		Display the complete structure designation (max. 63 characters) or ID number (25 characters) in a zoom window.
	TXT ID	Temporarily switch back and forth between structure designation and ID number. These keys don't have any effect on the main setting in the setup menu (see "DB Mode" on page 30).
	🔍−	Hide the zoom window
» 1/3		Change display to menu selection
		Memory Menu, Page 2 of 3
⊞		Add a structure element

Icons		Meaning
		Meanings of icons from top to bottom: Customer, building, distributor, RCD, electrical circuit, operating equipment, machine and earth electrode (display of the icons depends on the selected structure element). Selection: UP/DOWN scroll keys and ↵ In order to add a designation to the selected structure element, refer to the edit menu in following column.
		Delete the selected structure element.
		Show measurement data, if a measurement has been performed for this structure element.
		Edit the selected structure element.
		Memory Menu, Page 3 of 3
ID		Search for ID number. > Enter complete ID number.
TXT		Search for text. > Enter full text (complete word).
ALL		Search for ID number or text.
	»	Continue searching.
		Edit menu
←		Cursor LEFT: Select an alphanumeric character.
→		Cursor RIGHT: Select an alphanumeric character.
↵		ENTER: accept an individual character.
	☑ ← →	Acknowledge entry Scroll left Scroll right
⇤ DEL		Delete character
Aa 0@		Switching amongst different types of alphanumeric characters:
	A	✓ABCDEFGHIJK LMNOPQRSTUVW XYZ␣←→ Upper case letters
	a	✓abcdefghijk lmnopqrstuvw xyz␣←→ Lower case letters

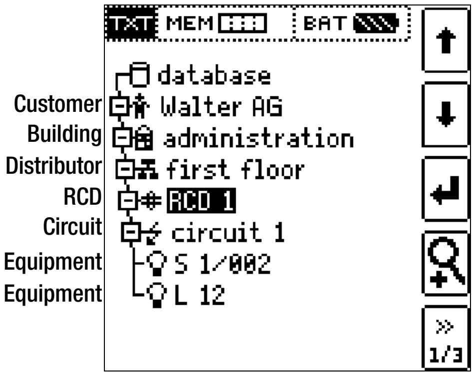
Distributor Structure Symbology / Tree Structure

A check mark to the right of a structure element means that all measurements within the respective hierarchy have been passed.
x: at least one measurement has not been passed.
No symbol: measurement has not yet been performed.



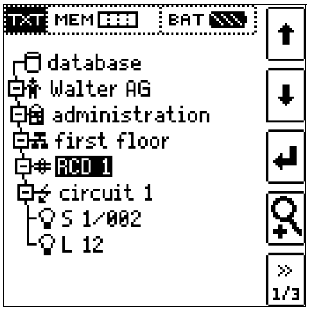
database
Walter AG
administration
first floor
RCD 1
circuit 1
S 1/002
L 12

Same type of element as in the Windows Explorer:
+: sub-objects available, display by pressing ↵.
–: sub-objects are displayed, hide by pressing ↵.

9.3.1 Creating Structures (example for electrical circuit)

After selection with the **MEM** key, all setting options for the creation of a tree structure are made available on three menu pages (1/3, 2/3 and 3/3). The tree structure consists of structure elements, referred to below as objects.

Selecting the Position at which a New Object will be Added



Scroll up

Scroll down

Comfirm selection / change level

Display object or ID number

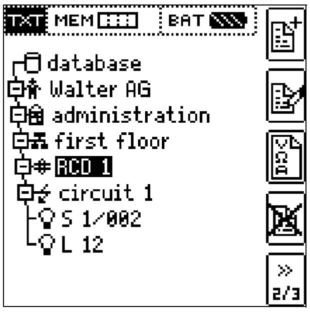
Next page

Use the ↑↓ keys in order to select structure elements.

Change to the sub-level with the ↵ key.

Go to the next page with the >> key

Creating a New Object



Create object

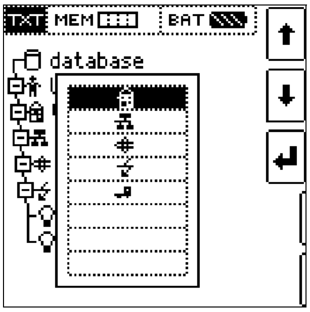
Edit designation

VΩA: Show measurement data

Delete object

Press the key in order to create a new object.

Select a new object from a list.



Scroll up

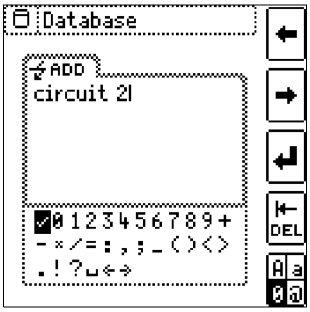
Scroll down

Comfirm selection

Select the desired object from the list with the ↑↓ keys and acknowledge with the ↵ key.

Depending upon the profile selected in the test instrument's **SETUP** menu (see section 8), the number of object types may be limited, and the hierarchy may be laid out differently.

Entering a Designation



Select character

Select character

↵ Accept character
✓Save object designation

Delete character

Character selection:
A, a, 0, @

Enter a designation and then acknowledge it with ✓.

Note

Acknowledge your entry with ✓and ↵, because the entry will otherwise not be accepted.

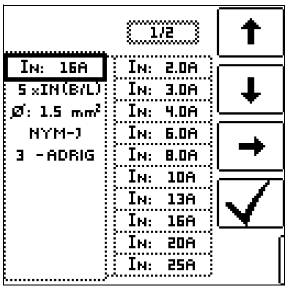
Entering a Comment

Enter a comment and then acknowledge it with ✓.

Note

Acknowledge your entry with ✓ and ↵, because the entry will otherwise not be accepted.

Setting Electrical Circuit Parameters



Select parameter
Select parameter setting

→ Parameter settings list
↵ Acknowledge parameter setting

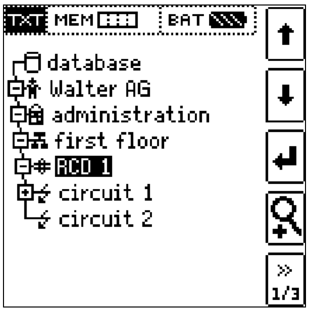
Acknowledge parameter selection and return to page 1/3 in the database menu.

For example, nominal current values must be entered here for the selected electrical circuit. Measuring parameters which have been accepted and saved in this way are subsequently accepted by the current measuring menu automatically when the display is switched from the structure view to measurement.

Note

Electrical circuit parameters changed during structure creation are also retained for individual measurements (measurement without saving data).
If you change the electrical circuit parameters specified by the structure in the test instrument, a warning is displayed when the change is saved (see error message on page 25).

9.3.2 Searching for Structure Elements



Scroll up

Scroll down

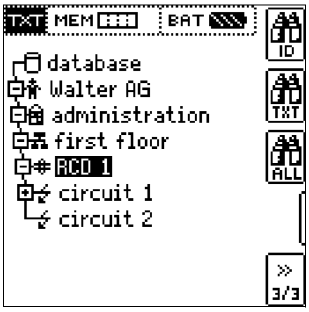
Comfirm selection / change level

Display object or ID number

Menu selection → page 3/3

Regardless of the currently selected object, the search is started at **database**.

Go to page **3/3** in the database menu.

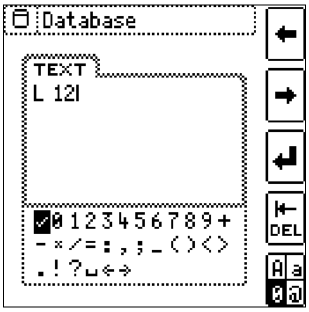


Search for ID number

Search for text

Search for ID number or text.

After selecting text search...



Select character

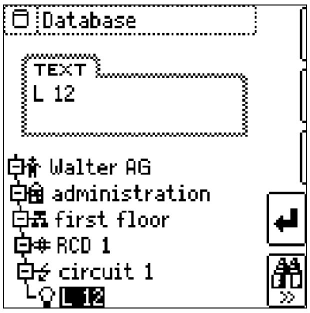
Select character

↵ Accept character
✓ Save object designation

Delete character

Character selection:

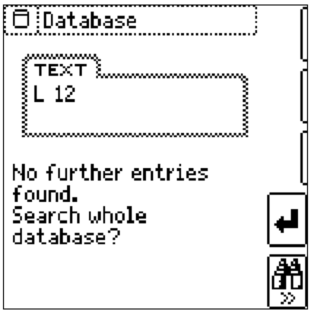
... and entering the desired text (only full matches are found – no wild cards, case sensitive) ...



Continue searching

... the first match is displayed.

Further matches can be found by selecting the icon shown at the right.



No further entries found. Search whole database?

End search

If no further matches are found, the message shown above is displayed.

9.4 Saving Data and Generating Reports

Preparing and Executing a Measurement

Measurements can be performed and stored to memory for each structure element. Proceed as follows, adhering to the prescribed sequence:

- ➪ Select the desired measurement with the rotary knob.
- ➪ Start the measurement by pressing the **ON/START ▼** or $I_{\Delta N}$ key.

Upon completion of measurement, the → **Floppy Disk** softkey is displayed.

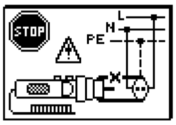
- ➪ **Briefly** press the **Save Value** key.

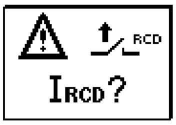
The display is switched to the memory menu or the structure view.

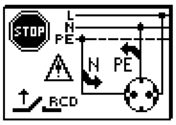
- ➪ Navigate to the desired memory location, i.e. to the desired structure element / object, for which the measurement data will be saved.
- ➪ If you would like to save a comment along with the measurement, press the key shown at the right and enter a designation via the "EDIT" menu as described in section 9.3.1.
- ➪ Complete data storage by pressing the "STORE" key.

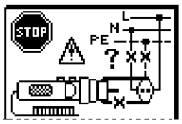
Saving Error Messages (pop-ups)

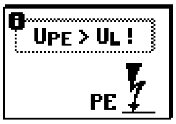
If a measurement is ended without a measured value due to an error, the measurement can be saved along with the pop-up by pressing the "Save Value" key. The corresponding text is read out in ETC instead of the pop-up symbol. This only applies to a limited number of pop-ups (see below). Neither a symbol nor a text can be accessed in the test instrument's database itself.











Alternative Storage Procedure

- ➪ The measured value can be saved to the last selected object in the structure diagram by **pressing and holding** the **Save Value** key, without switching the display to the memory menu.

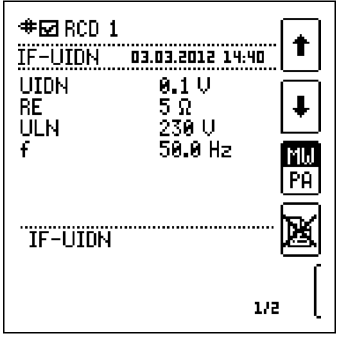
Note

If you change the parameters in the measurement view, they're not saved for the structure element. A measurement with changed parameters can nevertheless be saved to the structure element, and any changed parameters are documented in the report for each measurement.

Retrieving Saved Measured Values

- ➪ Switch the display to the distributor structure by pressing the **MEM** key and select the desired electrical circuit with the scroll keys.
- ➪ Switch to page 2 by pressing the key shown here:
- ➪ Display the measurement data by pressing the key shown here:

One measurement with date and time, as well as any comment you might have entered, is displayed in each screen.
Example:
RCD Measurement



RCD 1
IF-UIDN 03.03.2012 14:40
UIDN 0.1 V
RE 5 Ω
ULN 230 V
f 50.0 Hz
IF-UIDN

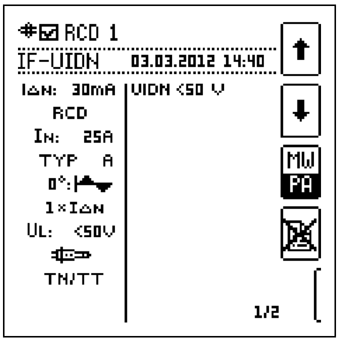
Note

A check mark in the header means that the respective measurement has been passed.
An X means that the measurement has not been passed.

- ➪ Scrolling amongst measurements is possible with the keys shown here:
- ➪ The measurement can be deleted with the key shown here:

A prompt window asks you to confirm deletion.

With the help of the key shown at the right (MW: measured value / PA: parameter), the setting parameters can be displayed for this measurement.



RCD 1
IF-UIDN 03.03.2012 14:40
IΔN: 30mA
RCD
IN: 25A
TYP A
0°:
1×IΔN
UL: <50V
TN/TT
UIDN <50 V

- ➪ Scrolling amongst measurements is possible with the keys shown here:

Data Evaluation and Report Generation with the Report Generating Program

All data, including the distributor structure, can be transferred to the PC and evaluated with the help of the report generating program. Additional information can be entered here subsequently for the individual measurements. After pressing the appropriate key, a report including all measurements within a given distributor structure is generated, or the data are exported to an Excel spreadsheet.

Note

The database is exited when the rotary selector switch is turned. Previously selected parameters in the database are not used for the measurement.

9.5 Use of Barcode Scanners and RFID Readers

Search for an Already Scanned Barcode

The search can be started from any switch setting and menu.

- ➪ Scan the object's barcode.

The recognized barcode is displayed inversely.

- ➪ This value is accepted after pressing the **ENTER** key.

Note

A previously selected object is not taken into consideration by the search.

Continued Searching in General

Regardless of whether or not an object has been found, searching can be continued by pressing the key shown at the right:

- – Object found: Searching is continued below the previously selected object.
- – Further object found: The entire database is searched at all levels.

Reading In a Barcode for Editing

If the menu for alphanumeric entry is active, any value scanned by means of a barcode or RFID reader is accepted directly.

Using a Barcode Printer (accessory)

The following functions are made possible with the help of a barcode printer:

- Read-out of ID numbers as barcodes – for quick and convenient acquisition for periodic testing
- Print out repeatedly occurring designations such as test object types encrypted as barcodes in a list, allowing them to be read in as required for comments

10 General Information on Measurements

10.1 Using Cable Sets and Test Probes

- Scope of delivery: 2-pole measuring adapter and cable for expansion into a 3-pole adapter (PRO-A3-II/)
- Optional accessory: PRO-RLO II (Z501P) 2-pole measuring adapter with 10 m cable
- Optional accessory: KS24 cable set (GTZ3201000R0001)

Measurements per DIN EN 61010-031 may only be performed in environments in accordance with measuring categories III and IV with the safety cap attached to the test probe at the end of the measurement cable.

In order to establish contact inside 4 mm jacks, the safety caps have to be removed by prying open the snap fastener with a pointed object (e.g. the other test probe).

Attention!

Grip and hold the test plug and test probes securely when they have been inserted, for example, into a socket. Danger of injury exists if tugging at the coil cord occurs, which may cause the test plug or test probes to snap back.

10.2 Test Plug – Changing Inserts

The test plug can be fitted with various inserts (e.g. two-pole measuring adapter or country-specific plug insert).

In order to change inserts, unscrew the retaining ring until you can pull out the currently used insert. Then mount the desired insert and retighten the retaining ring.

(See overview in section 5.4 on page 8.)

10.3 Connecting the Instrument

For systems with earthing contact sockets, connect the instrument to the mains with the test plug to which the appropriate, country-specific plug insert is attached. Voltage between phase conductor L and protective conductor PE may not exceed 253 V! Poling at the socket need not be taken into consideration. The instrument detects the positions of phase conductor L and neutral conductor N, and automatically reverses polarity if necessary. This does not apply to the following measurements:

– Voltage measurement in switch position U

– Insulation resistance measurement

– Low-resistance measurement

The positions of phase conductor L and neutral conductor N are identified on the plug insert.

If measurement is to be performed at three-phase outlets, at distribution cabinets or at permanent connections, the measuring adapter must be attached to the test plug. Connection is established with the test probes: one at PE or N and the other at L.

The 2-pole measuring adapter must be expanded to 3 poles with the included measurement cable for the performance of phase sequence testing.

Touch voltage (during RCCB testing) and earthing resistance can be, and earth-electrode potential, standing surface insulation resistance and probe voltage must be measured with a probe. The probe is connected to the probe connector socket with a 4 mm contact-protected plug.

10.4 Automatic Settings, Monitoring and Shutdown

The test instrument automatically selects all operating conditions which it's capable of determining itself. It tests line voltage and frequency. If these lie within their valid nominal ranges, they appear at the display panel. If they are not within nominal ranges, prevailing voltage (U) and frequency (f) are displayed instead of U_N and f_N.

Touch voltage which is induced by test current is monitored for each measuring sequence. If touch voltage exceeds the limit value of > 25 V or > 50 V, measurement is immediately interrupted. The U_L/R_L LED lights up red.

If **battery voltage** falls below the permissible limit value the instrument cannot be switched on, or it is immediately switched off.

The measurement is interrupted automatically, or the measuring sequence is blocked (except for voltage measuring ranges and phase sequence testing) in the event of:

- Impermissible line voltages (< 60 V, > 253 V / > 330 V / > 440 V or > 550 V) for measurements which require line voltage
- Interference voltage during insulation resistance or low resistance measurements
- Overheating at the instrument
  As a rule, excessive temperatures only occur after approximately 50 measurement sequences at intervals of 5 seconds, when the rotary selector switch is set to the Z_{L-PE} or Z_{L-N} position.
  If an attempt is made to start a measuring sequence, an appropriate message appears at the display panel.

The instrument only switches itself off automatically after completion of an automatic measuring sequence, and after the predetermined on-time has expired (see section 7.2). On-time is reset to its original value as defined in the setup menu, as soon as any key or the rotary selector switch is activated.

The instrument remains on for approximately 75 s in addition to the preset on-time for measurements with rising residual current in systems with selective RCDs.

The instrument always shuts itself off automatically!

10.5 Measured Value Display and Memory

The following items appear at the display panel:

- Measured values with abbreviations and units of measure
- Selected function
- Nominal voltage
- Nominal frequency
- Error messages

Measured values for automatic measuring sequences are stored and displayed as digital values until the next measurement sequence is started, or until automatic shutdown occurs.
If the upper range limit is exceeded, the upper limit value is displayed and is preceded by the ">" symbol (greater than), which indicates measurement value overrun.

Note

The depiction of LEDs in these operating instructions may vary from the LEDs on the actual instrument due to product improvements.

Testing Earthing Contact Sockets for Correct Connection

The testing of earthing contact sockets for correct connection prior to protective measures testing is simplified by means of the instrument's error detection system.

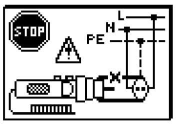
The instrument indicates improper connection as follows:

- **Impermissible line voltage (< 60 V or > 253 V):**
  The MAINS/NETZ LED blinks red and the measuring sequence is disabled.
- **Protective conductor not connected or potential to earth ≥ 50 V at ≥ 50 Hz** (switch position U – single-phase measurement)**:**
  If the contact surfaces are touched (**finger contact***) while PE is being contacted (via the country-specific plug insert, e.g. SCHUKO, as well as via the PE test probe at the 2-pole adapter) PE appears (only after a test sequence has been started). The U_L/R_L and RCD/FI LEDs light up red as well.

  * For reliable detection of touch voltages, both sensor surfaces on the test plug must be touched with unprotected fingers/palm, i.e. with direct skin contact (see also section 7).
- **Neutral conductor N not connected**
  (during mains dependent measurements):
  The MAINS/NETZ LED blinks green.

- **One of the two protective contacts is not connected:**
  This is checked automatically during testing for touch current $U_{I\Delta N}$. Poor contact resistance at one of the contacts leads to one of the following displays depending upon poling of the plug:
  - **Display at the connection pictograph:**
    PE interrupted (x), or underlying protective conductor bar interrupted with reference to the keys at the test plug
    Cause: Voltage measuring path interrupted
    Consequence: measurement is disabled

  - **Display at the connection pictograph:**
    Top protective conductor bar interrupted with reference to the keys at the test plug
    Cause: current measuring path interrupted
    Result: no measured value display



Note

See “LED Indications, Mains Connections and Potential Differences” on page 17.

Attention!

Reversal of N and PE in a system without RCCBs cannot be detected and is not indicated by the instrument.
In a system including an RCCB, the RCCB is tripped during touch voltage measurement without RCCB tripping (automatic Z_{L-N} measurement), insofar as N and PE are reversed.

10.6 Help Function

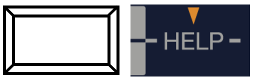
The following information can be displayed for each switch position and basic function **after it has been selected with the** rotary selector switch:

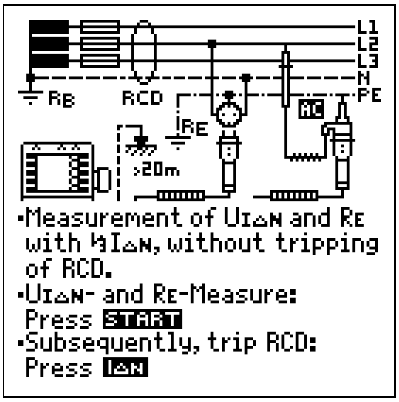
- Wiring diagram
- Measuring range
- Nominal range of use as well as measuring and intrinsic uncertainties
- Nominal value

➪ Press the **HELP** key in order to query online help.

➪ If several pages of help are available for the respective measuring function, the **HELP** key must be pressed repeatedly.

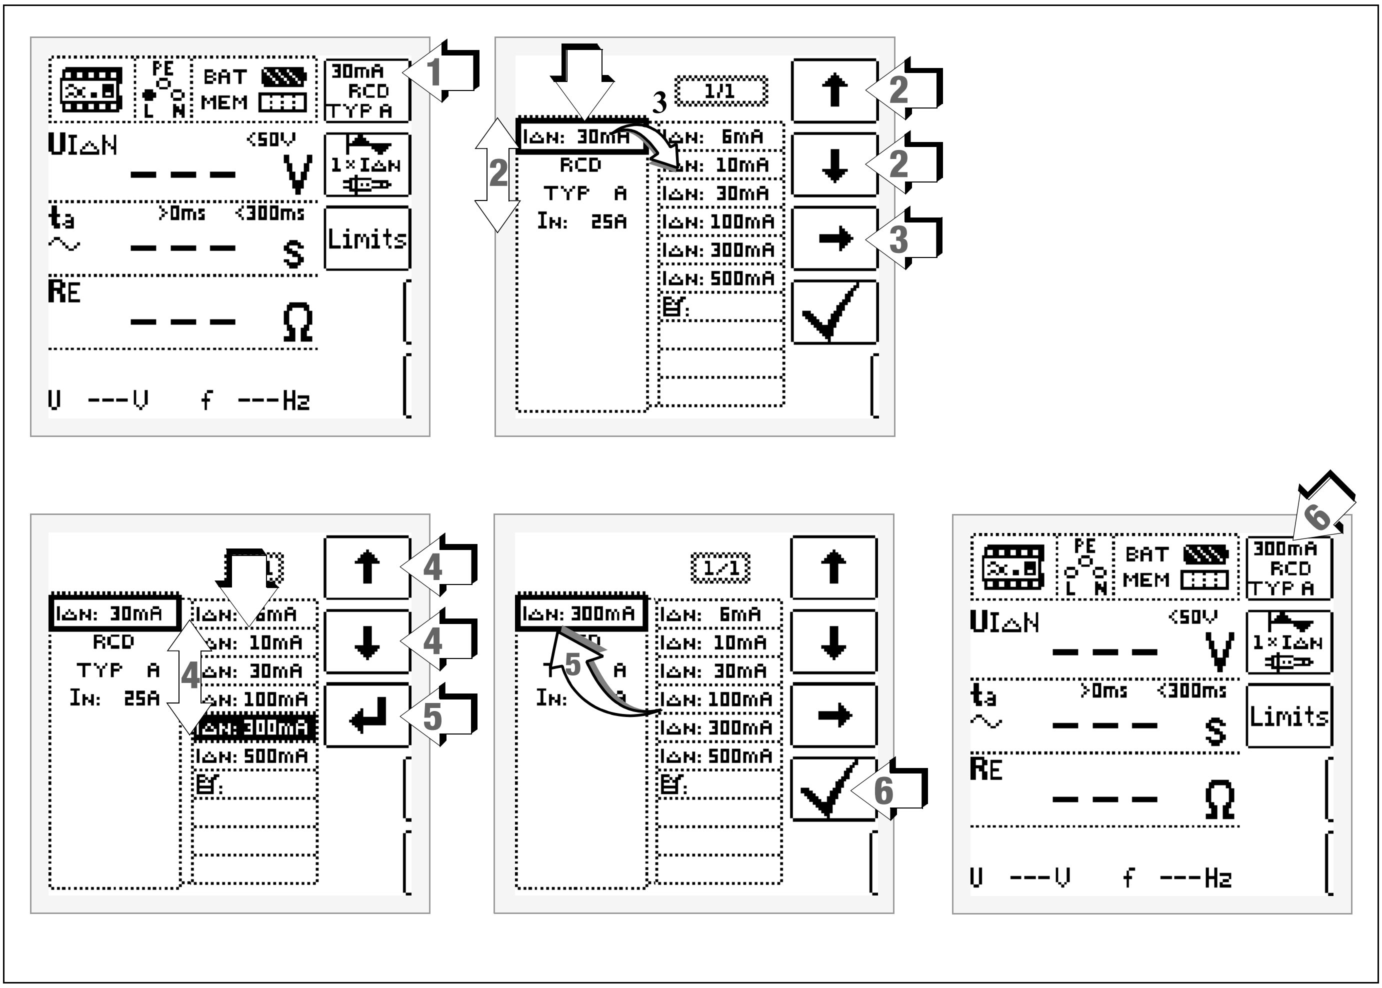
➪ Press the **ESC** key in order to exit online help.





•Measurement of $U_{I\Delta N}$ and R_E with $\frac{1}{2} I_{\Delta N}$, without tripping of RCD.
•$U_{I\Delta N}$- and R_E-Measure:
Press START
•Subsequently, trip RCD:
Press $I_{\Delta N}$

10.7 Setting Parameters or Limit Values using RCD Measurement as an Example



1 Access the submenu for setting the desired parameter.
2 Select a parameter using the ↑ or ↓ scroll key.
3 Switch to the setting menu for the selected parameter with the → scroll key.
4 Select a setting value using the ↑ or ↓ scroll key.
5 Acknowledge the setting value with the ↵ key. This value is transferred to the settings menu.
6 The setting value is not permanently accepted for the respective measurement until ✓ is pressed, after which the display is returned to the main menu. You can return to the main menu by pressing **ESC** instead of ✓, without accepting the newly selected value.

Parameter Lock (plausibility check)

Individually selected parameter settings are checked for plausibility before transfer to the measurement window.

If you select a parameter setting which doesn't make sense in combination with other parameter settings which have already been entered, it's not accepted. The previously selected parameter setting remains unchanged.

Remedy: select another parameter setting.

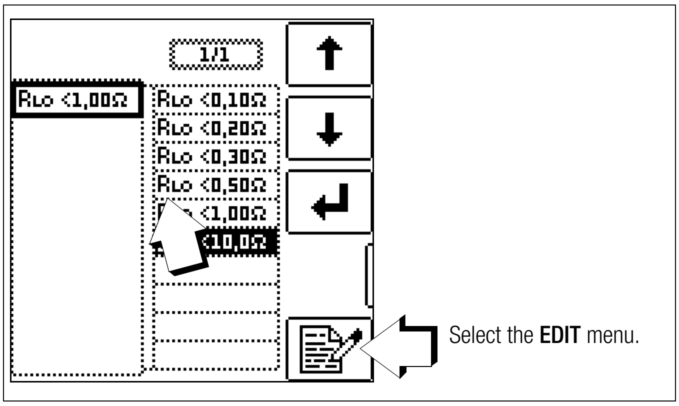
10.8 Freely Selectable Parameter Settings or Limit Values

10.8.1 Changing Existing Parameters

Individual parameters can be changed for certain measuring functions, i.e. adjusted within predetermined limits.

The **EDIT** menu doesn't appear until after switching to the right-hand column and selecting the editable parameter.

Example for RLO Measuring Function – Parameter: LIMIT RLO

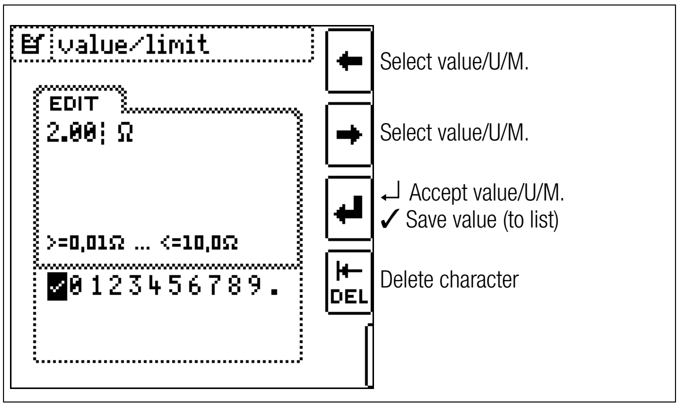


Select the **EDIT** menu.

1 Open the submenu for setting the desired parameter (no figure, see section 10.7).

2 Select the editable parameter – identified with the icon – with the ↑ or ↓ scroll key.

3 Select the edit menu by pressing the key.



Select value/U/M.

Select value/U/M.

↵ Accept value/U/M.
✓ Save value (to list)

Delete character

4 Select the respective characters with the left or right cursor key. The character is accepted by pressing the ↵ key. The value is acknowledged by selecting ✓ and then pressing the ↵ key.

☞ **Note**

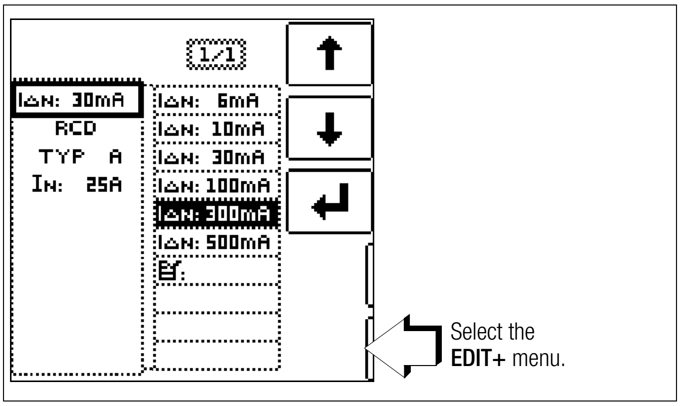
Observe the predefined limits for the new setting value. Enter any places to the right of the decimal point as well.

10.8.2 Adding New Parameters

For certain measuring functions, additional values within predefined limits can be added in addition to the fixed values.

The **EDIT+** menu doesn't appear until after switching to the right-hand column.

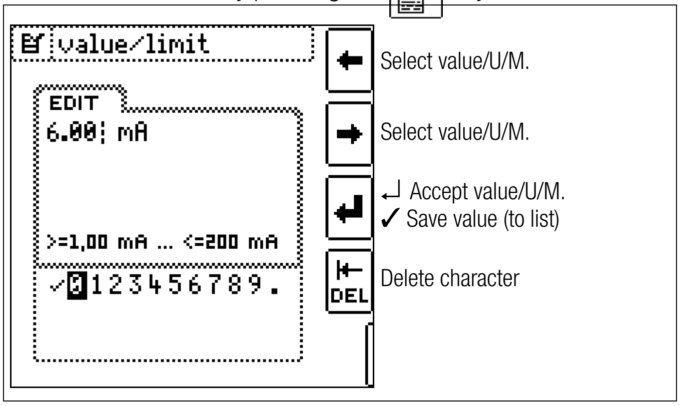
Example for $I_{\Delta N}$ Measuring Function – Parameter: $I_{\Delta N}$



Select the **EDIT+** menu.

1 Open the submenu for setting the desired parameter (no figure, see section 10.7).

Select the edit menu by pressing the key.



Select value/U/M.

Select value/U/M.

↵ Accept value/U/M.
✓ Save value (to list)

Delete character

2 Select the respective characters with the **LEFT** or **RIGHT** cursor key. The character is accepted by pressing the ↵ key. The value is acknowledged by selecting ✓ and then pressing the ↵ key. The new parameter is added to the list.

☞ **Note**

Observe the predefined limits for the new setting value. Enter any places to the right of the decimal point as well.

10.9 2-Pole Measurement with Rapid or Semiautomatic Polarity Reversal

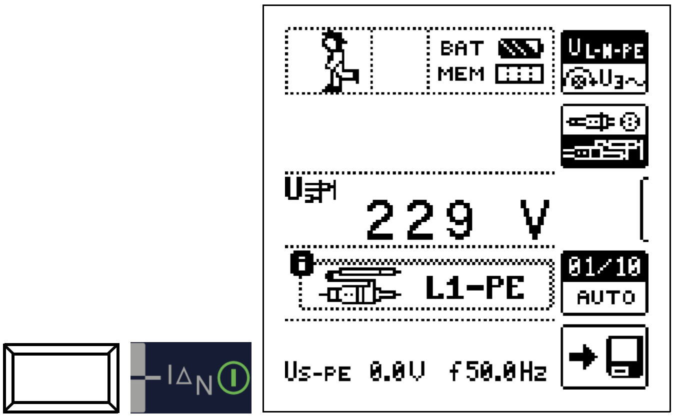
Rapid, semiautomatic polarity reversal is possible for the following measurements:

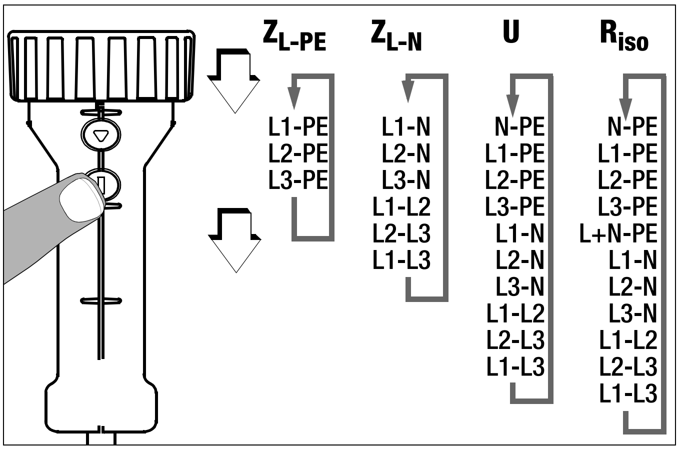
- Voltage **U**
- Loop impedance **Z_{LP-E}**
- Internal line resistance **Z_{L-N}**
- Insulation resistance **R_{INS}**

Rapid Polarity Reversal at the Test Plug

The polarity parameter is set to **AUTO**.

Fast and convenient switching amongst all polarity variants, or switching to the parameter settings submenu, is possible by pressing the **$I_{\Delta N}$** key at the instrument or the test plug.



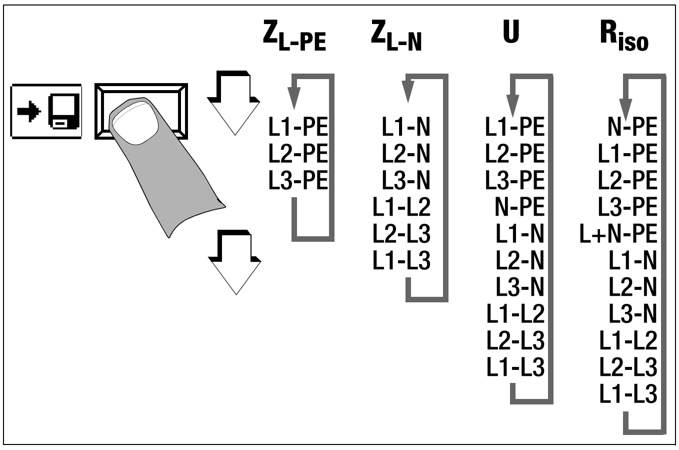


Semiautomatic Polarity Reversal in Memory Mode

The polarity parameter is set to **AUTO**.

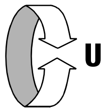
If testing is to be conducted with all polarity variants, automatic polarity changing takes place after each measurement after **saving**.

Polarity variants can be skipped by pressing the **$I_{\Delta N}$** key at the instrument or the test plug.



11 Measuring Voltage and Frequency

Select the Measuring Function

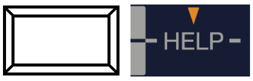


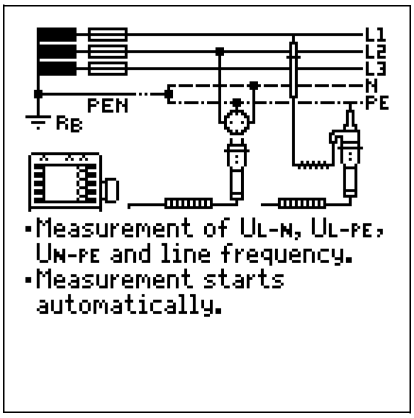
Switch Back and Forth Between Single and 3-Phase Measurement

Press the softkey shown at the left in order to switch back and forth between single and 3-phase measurement. The selected phase measurement is displayed inversely (white on black).

11.1 Single-Phase Measurement

Connection



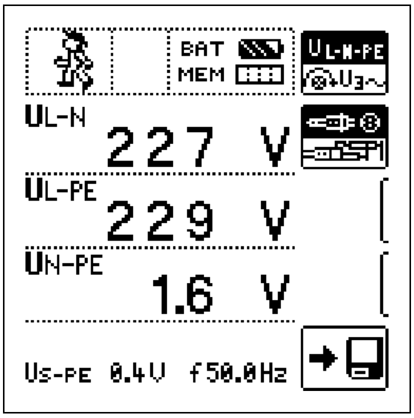


•Measurement of UL-N, UL-PE, UN-PE and line frequency.
•Measurement starts automatically.

A probe must be used in order to measure probe voltage $U_{S\text{-}PE}$.

11.1.1 Voltage Between L and N ($U_{L\text{-}N}$), L and PE ($U_{L\text{-}PE}$) and N and PE ($U_{N\text{-}PE}$) with Country-Specific Plug Insert, e.g. SCHUKO

Press the softkey shown at the left in order to switch back and forth between the country-specific plug insert, e.g. SCHUKO, and the 2-pole adapter. The selected connection type is displayed inversely (white on black).



UL-N 227 V
UL-PE 229 V
UN-PE 1.6 V
US-PE 0.4V f50.0Hz

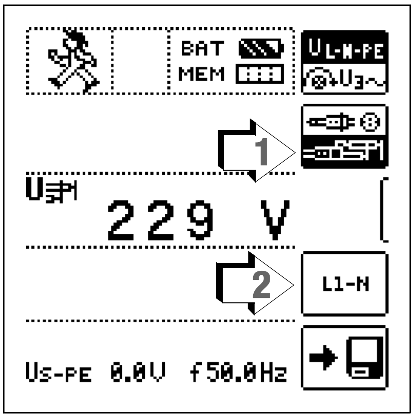
Note

If you view the country-specific plug insert, e.g. SCHUKO, from the front, you'll see two embossed letters, namely L and N. Automatic polarity reversal does not take place during voltage measurement. You can thus specify the terminal to which the phase is connected in the socket. If (mains) voltage is displayed for UL-PE, then the phase is located where L appears on the connector. If (mains) voltage is displayed for N-PE, then the phase is located where N appears on the connector.

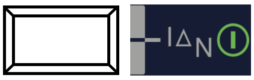
11.1.2 Voltage Between L – PE, N – PE and L – L with 2-Pole Adapter Connection

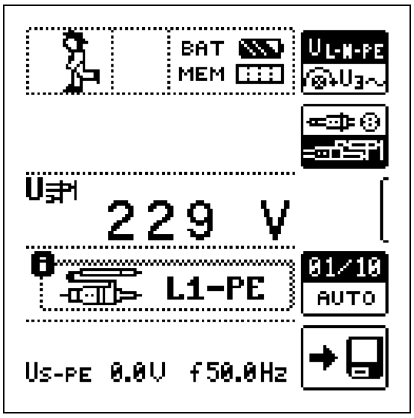
Press the softkey shown at the left in order to switch back and forth between the country-specific plug insert, e.g. SCHUKO, and the 2-pole adapter. The selected connection type is displayed inversely (white on black).

See section 10.9 concerning 2-pole measurement with rapid or semiautomatic polarity reversal.



229 V
US-PE 0.0V f50.0Hz



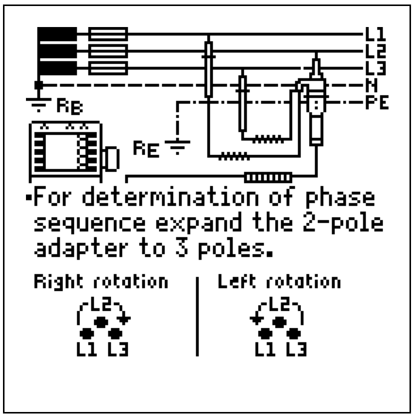


229 V
US-PE 0.0V f50.0Hz

11.2 3-Phase Measurement (line-to-line voltage) and Phase Sequence

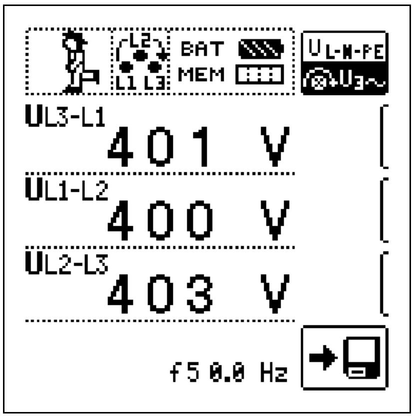
Connection

The measuring adapter (2-pole) is required in order to connect the instrument, and is expanded to a 3-pole measuring adapter with the included measurement cable.



•For determination of phase sequence expand the 2-pole adapter to 3 poles.

➪ Press softkey U3~.



UL3-L1 401 V

UL1-L2 400 V

UL2-L3 403 V

f 50.0 Hz

A clockwise phase sequence is required at all 3-phase electrical outlets.

- Measurement instrument connection is usually problematic with CEE outlets due to contact problems.
  Measurements can be executed quickly and reliably without contact problems with the help of the Z500A variable plug adapter set available from GMC.
- Connection for 3-wire measurement: L1-L2-L3 at plug in clockwise direction as of PE socket

Direction of rotation is indicated by means of the following displays:

Clockwise Rotation

Counterclockwise Rotatio

☞ **Note**

See section 6.4 regarding all indications for the mains connection test.

Voltage Polarity

If the installation of single-pole switches to the neutral conductor is prohibited by the standards, voltage polarity must be tested in order to assure that all existing single-pole switches are installed to the phase conductors.

12 Testing RCDs

The testing of residual current devices (RCDs) includes:

- Visual inspection
- Testing
- Measurement

Use the test instrument for testing and measurement.

Attention!

When testing systems with RCCBs, they may switch off. This may occur even though it's not normally provided for by the test. Leakage currents may be present which, in combination with the test current of the test instrument, exceed the shutdown threshold value of the RCCB. PCs which are operated in proximity to such RCCB systems may switch off as a consequence. This may result in inadvertent loss of data. Before conducting the test, precautions should therefore be taken to ensure that all data and programs are suitably backed up and the computer should be switched off, if necessary. The manufacturer of the test instrument assumes no liability for any direct or indirect damage to equipment, computers, peripheral equipment or data bases when performing the tests.

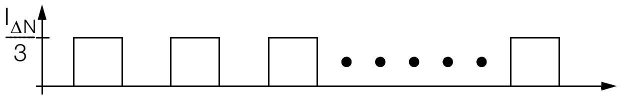
Measuring Method

The following must be substantiated by generating a fault current downstream from the RCD:

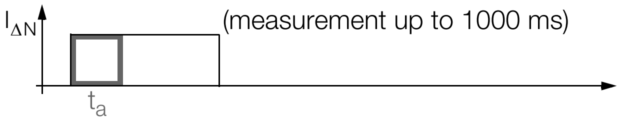
- That the RCD is tripped no later than upon reaching its nominal fault current value
- That the continuously permissible touch voltage value U_L agreed upon for the respective system is not exceeded

This is achieved by means of:

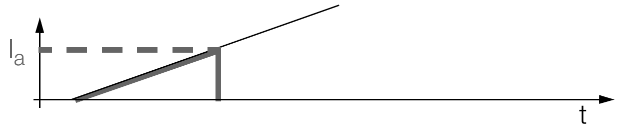
- Touch voltage measurement
  10 measurements with full-waves and extrapolation of $I_{\Delta N}$



- Substantiation of tripping within 400 ms or 200 ms with $I_{\Delta N}$



- Substantiation of tripping current with rising residual current
  This value must be between 50% and 100% of $I_{\Delta N}$ (usually about 70%).



- No premature tripping with the test instrument, because testing is begun with 30% residual current (if no bias current occurs within the system).

RCD/FI Table	**Waveform Differential Current**	**Correct RCD/RCCB Function**

	Slowly rising 				
Direct current				✔	✔
Direct current up to 6 mA					✔

* only PROFITEST MTECH+, PROFITEST MXTRA

Test Standard

The following must be substantiated per IEC 60364-6:

- – Touch voltage occurring at nominal residual current may not exceed the maximum permissible value for the system.
- – Tripping of the RCCB must occur within 400 ms (1000 ms for selective RCDs) at nominal residual current.

Important Notes

- The test instrument permits simple measurements at all types of RCDs. Select RCD, SRCD, PRCD etc.
- Measurement must be executed at one point only per RCD (RCCB) within the connected electrical circuits. Low-resistance continuity must be substantiated for the protective conductor at all other connections within the electrical circuit (R_{LO} or U_B).
- The measuring instruments often display 0.1 V touch voltage in TN systems due to low protective conductor resistance.
- Be aware of any bias currents within the system. These may cause tripping of the RCDs during measurement of touch voltage U_B, or may result in erroneous displays for measurements with rising current:
  Display = I_F◢ - $I_{bias\ current}$
- Selective RCDs identified with an $\boxed{S}$ can be used as the sole means of protection for automatic shutdown if they adhere to the same shutdown conditions as non-selective RCDs (i.e. t_a < 400 ms). This can be verified by measuring breaking time.
- Type B RCDs may not be connected in series with type A or F RCDs.

Note

Bias Magnetization

Only AC measurements can be performed with the 2-pole adapter. Suppression of RCD tripping by means of bias magnetization with direct current is only possible via a country-specific plug insert, e.g. SCHUKO, or the 3-pole adapter.

Measurement With or Without Probe

Measurements can be performed with or without a probe.

Measurements with probe require that the probe and reference earth are of like potential. This means that the probe must be positioned outside of the potential gradient area of the earth electrode (R_E) in the RCD safety circuit.

The distance between the earth electrode and the probe should be at least 20 m.

The probe is connected with a 4 mm contact-protected plug.

In most cases this measurement is performed without probe.

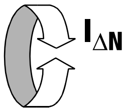
Attention!

The probe is part of the measuring circuit and may carry a current of up to 3.5 mA in accordance with IEC 61557 / EN 61557.

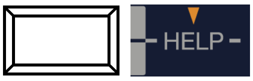
Testing for the absence of voltage at the probe can be performed with the U_{PROBE} function (see also section 11.1 on page 42).

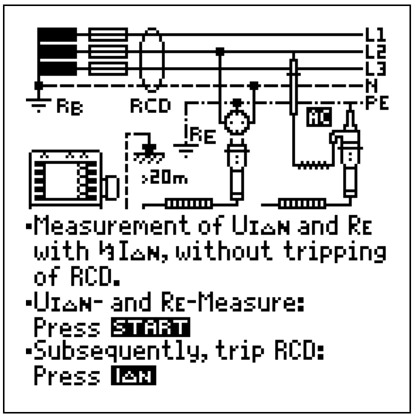
12.1 Measuring Touch Voltage (with reference to nominal residual current) with ⅓ Nominal Residual Current and Tripping Test with Nominal Residual Current

Select Measuring Function



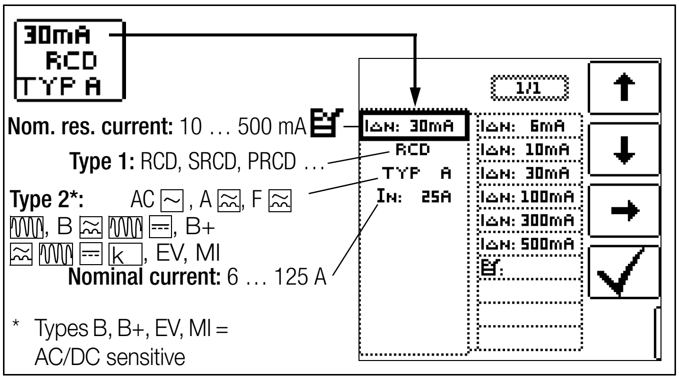
Connection





•Measurement of UIΔN and RE with ½IΔN, without tripping of RCD.
•UIΔN- and RE-Measure: Press START
•Subsequently, trip RCD: Press IΔN

Set Parameters for $I_{\Delta N}$



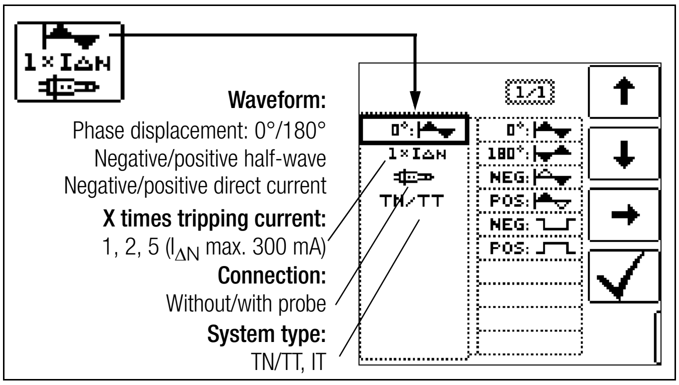
Nom. res. current: 10 … 500 mA

Type 1: RCD, SRCD, PRCD …

Type 2*: AC, A, F, B, B+, EV, MI

Nominal current: 6 … 125 A

* Types B, B+, EV, MI = AC/DC sensitive

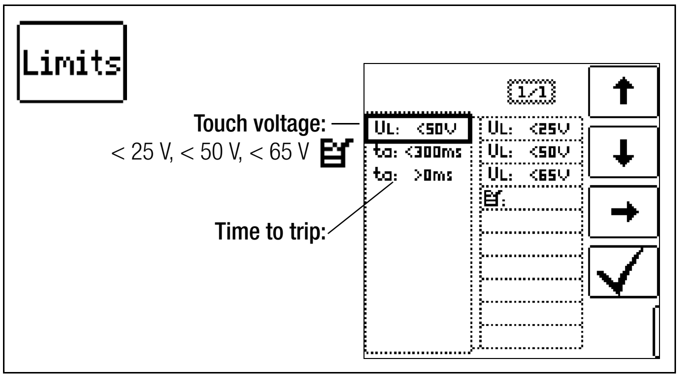


Waveform:
Phase displacement: 0°/180°
Negative/positive half-wave
Negative/positive direct current

X times tripping current:
1, 2, 5 ($I_{\Delta N}$ max. 300 mA)

Connection:
Without/with probe

System type:
TN/TT, IT



Touch voltage:
< 25 V, < 50 V, < 65 V

Time to trip:

1) Measuring Touch Current Without Tripping the RCD

Measuring Method

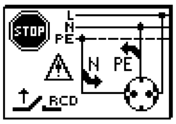
The instrument uses a measuring current of only 1/3 nominal residual current for the determination of touch voltage $U_{I\Delta N}$ which occurs at nominal residual current. This prevents tripping of the RCCB.

This measuring method is especially advantageous, because touch voltage can be measured quickly and easily at any electrical outlet without tripping the RCCB.

The usual, complex measuring method involving testing for the proper functioning of the RCD at a given point, and subsequent substantiation that all other systems components requiring protection are reliably connected at low resistance values to the selected measuring point via the PE conductor, is made unnecessary.

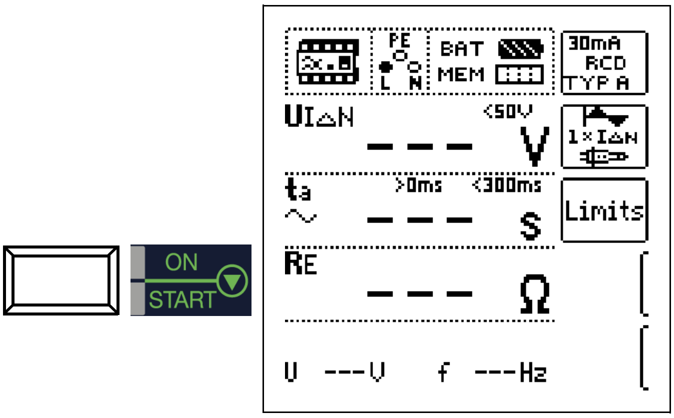
N-PE Reversal Test

Additional testing is conducted in order to determine whether or not N and PE are reversed. The pop-up window shown at the right appears in the event of reversal.



Attention!
In order to prevent the loss of data in data processing systems, perform a data backup before starting the measurement and switch off all consumers.

Start Measurement



Amongst other values, touch voltage $U_{I\Delta N}$ and calculated earthing resistance R_E appear at the display panel.

Note
The measured earthing resistance value R_E is acquired with very little current. More accurate results can be obtained with the selector switch in the R_E position. The DC + function can be selected here for systems with RCCBs.

Unintentional Tripping of the RCD due to Bias Current in the System

Any bias current which might occur can be ascertained as described in section 18.1 on page 81 with the help of a current clamp transformer. The RCCB may be tripped during the testing of touch voltage if extremely large bias currents are present within the system, or if a test current was selected which is too great for the RCCB.

After touch voltage has been measured, testing can be performed to determine whether or not the RCCB is tripped within the selected time limit values at nominal residual current.

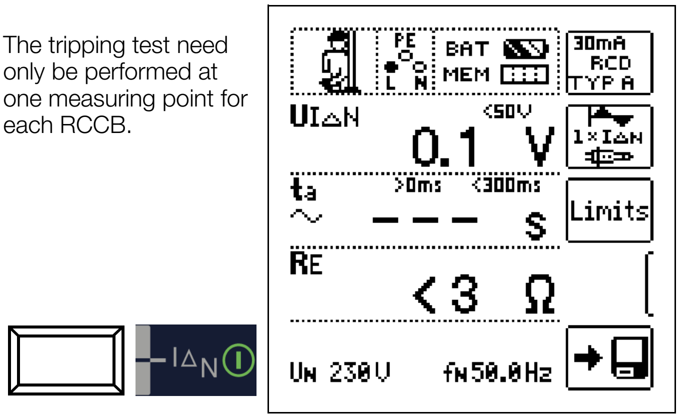
Unintentional Tripping of the RCD due to Leakage Current in the Measuring Circuit

Measurement of touch voltage with 30% nominal residual current does not normally trip an RCCB. However, the trip limit may be exceeded as a result of leakage current in the measuring circuit, e.g. due to interconnected consumers with EMC circuit, e.g. frequency converters or PCs.

2) Tripping Test after the Measurement of Touch Voltage

➩ Press the $I_{\Delta N}$ key.

The tripping test need only be performed at one measuring point for each RCCB.



If the RCCB is not tripped at nominal residual current,
the MAINS/NETZ LED blinks red (line voltage disconnected) and, amongst other values, time to trip t_a and earthing resistance R_E appear at the display panel.

If the RCCB is not tripped at nominal residual current,
the RCD/FI LED lights up red.

Touch Voltage Too High

If touch voltage $U_{I\Delta N}$, which has been measured with 1/3 nominal residual current $I_{\Delta N}$ and extrapolated to $I_{\Delta N}$, is > 50 V (> 25 V), the U_L/R_L LED lights up red.

If the limit value for touch voltage is exceeded during the measurement process, $U_{I\Delta N}$ > 50 V (> 25 V), safety shutdown occurs for Germany (65 V applies for Austria – standard: ÖVE/ÖNORM E 8001-1 section 5.3).

Note
Safety shutdown: At up to 70 V, a safety shutdown is tripped within 3 s in accordance with IEC 61010.

Touch voltages of up to 70 V are displayed. If the value is greater than 70 V, $U_{I\Delta N}$ > 70 V is displayed.

Limit Values for Permissible, Continuous Touch Voltage

The limit for permissible, continuous touch voltage is equal to U_L = 50 V for alternating voltages (international agreement). Lower values have been established for special applications (e.g. medical applications: U_L = 25 V).

Attention!
If touch voltage is too high, or if the RCCB is not tripped, the system must be repaired (e.g. earthing resistance is too high, defective RCCB etc.)!

3-Phase Connections

For proper RCD testing at three-phase connections, the tripping test must be conducted for one of the three phase conductors (L1, L2 or L3).

Inductive Power Consumers

Voltage peaks may occur within the measuring circuit if inductive consumers are shut down during an RCCB trip test. If this is the case, the test instrument might not display any measured value (– – –). If this message appears, switch all consumers off before performing the trip test. In extreme cases, one of the fuses in the test instrument may blow, and/or the test instrument may be damaged.

12.2 Special Tests for Systems and RCDs

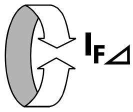
12.2.1 Testing Systems and RCCBs with Rising Residual Current (AC) for Type AC, A/F, B/B+ and EV/MI RCDs (PROFITEST MTECH+, PROFITEST MXTRA only)

Measuring Method

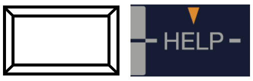
The instrument generates a continuously rising residual current of (0.3 … 1.3) × $I_{\Delta N}$ within the system for the testing of RCDs. The instrument stores the touch voltage and tripping current values which were measured at the moment tripping of the RCCB occurred, and displays them.

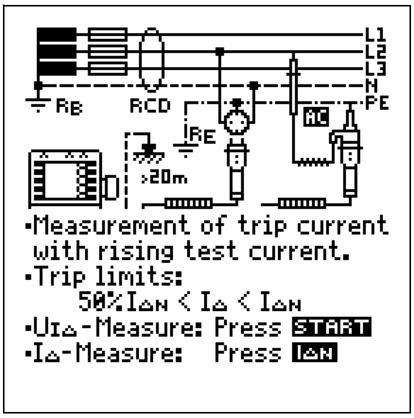
One of the touch voltage limit values, U_L = 25 V or U_L = 50/65 V, can be selected for measurement with rising residual current.

Select Measuring Function



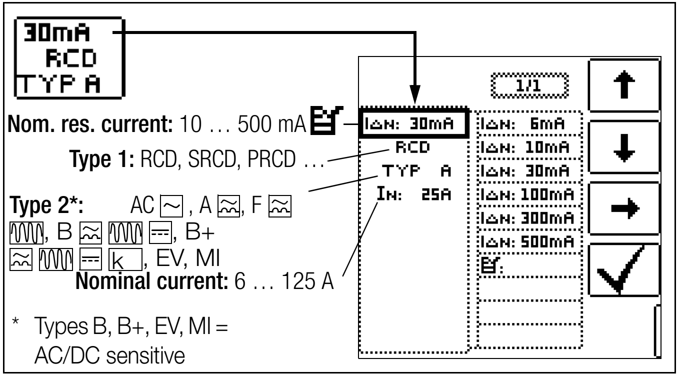
Connection

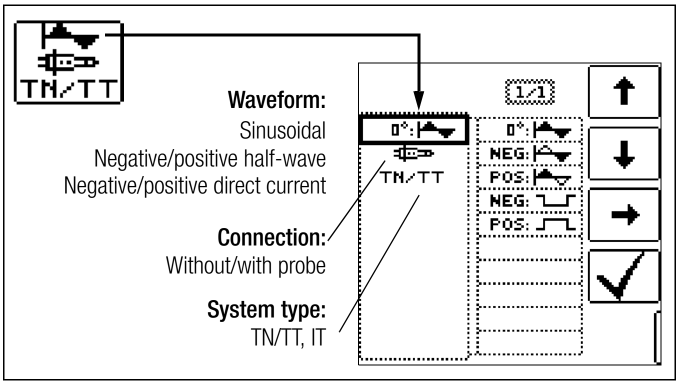


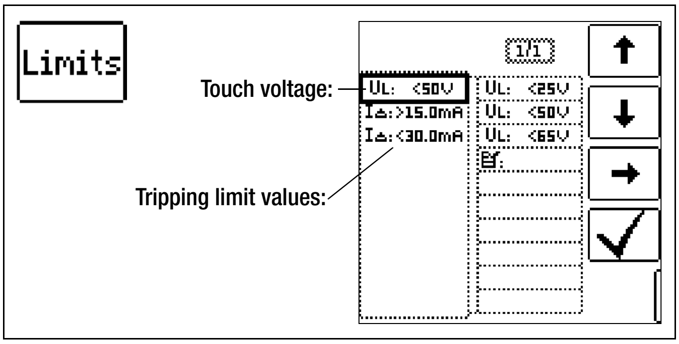


•Measurement of trip current with rising test current.
•Trip limits:
50%IΔN < IΔ < IΔN
•UIΔ-Measure: Press START
•IΔ-Measure: Press IΔN

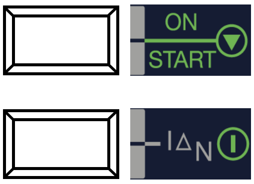
Set Parameters for IF⊿

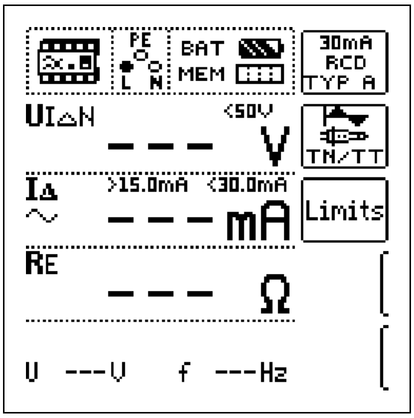






Start Measurement





Measuring Procedure

After the measuring sequence has been started, the test current generated by the instrument is continuously increased starting at 0.3 times nominal residual current, until the RCCB is tripped. This can be observed by viewing gradual filling of the triangle at IΔ.

If touch voltage reaches the selected limit value (U_L = 65 V, 50 V or 25 V) before the RCCB is tripped, safety shutdown occurs. The U_L/R_L LED lights up red.

Note

Safety shutdown: At up to 70 V, safety shutdown is triggered within 3 s in accordance with IEC 61010.

If the RCCB is not tripped before rising current reaches nominal residual current $I_{\Delta N}$, the RCD/FI LED lights up red.

Attention!

If bias current is present within the system during measurement, it's superimposed onto the residual current which is generated by the instrument and influences measured values for touch voltage and tripping current. See also section 12.1.

Evaluation

According to IEC 60364-6, rising residual current must, however, be used for measurements in the evaluation of RCDs, and touch voltage at nominal residual current $I_{\Delta N}$ must be calculated from the measured values.

The faster, more simple measuring method should thus be taken advantage of (see section 12.1).

12.2.2 Testing Systems and RCCBs with Rising Residual Current (AC) for Type B/B+ and EV/MI RCDs (PROFITEST MTECH+PROFITEST MXTRA)

In accordance with IEC 61557 / EN 61557, it must be substantiated that, with smooth direct current, residual operating current is no more than twice the value of rated residual current $I_{\Delta N}$. A continuously rising direct current, beginning with 0.2 times rated residual current $I_{\Delta N}$, must be applied to this end. If current rise is linear, rising current may not exceed twice the value of $I_{\Delta N}$ within a period of 5 seconds.

Testing with smoothed direct current must be possible in both test current directions.

12.2.3 Testing RCCBS with 5 × $I_{\Delta N}$

Measurement of time to trip is performed here with 5 times nominal residual current.

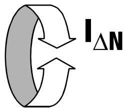
Note

Measurements performed with 5 times nominal fault current are required for testing type S and G RCCBs in the manufacturing process. They're used for personal safety as well.

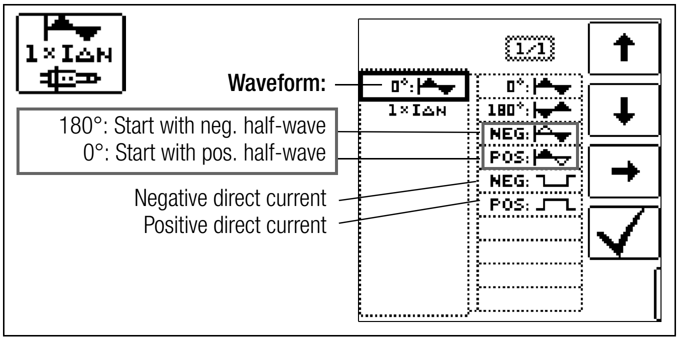
Measurement can be started with the positive half-wave at "0°" or with the negative half-wave at "180°".

Both measurements must nevertheless be performed. The longer of the two tripping times is decisive regarding the condition of the tested RCCB. Both values must be less than 40 ms.

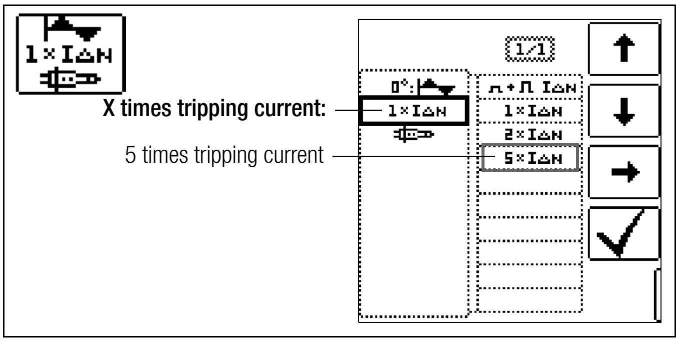
Select Measuring Function



Set Parameter – Start with Positive or Negative Half-Wave



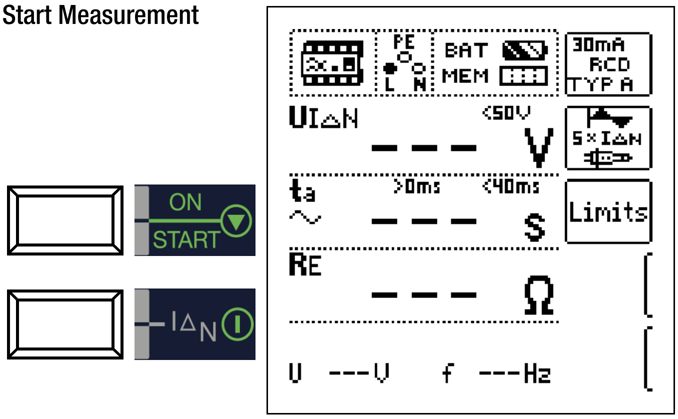
Set Parameter – 5 Times Nominal Current



Note

The following restrictions apply to the selection of tripping current multiples relative to nominal current:
500 mA: 1 × $I_{\Delta N}$, 2 × $I_{\Delta N}$

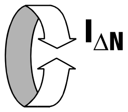
Start Measurement



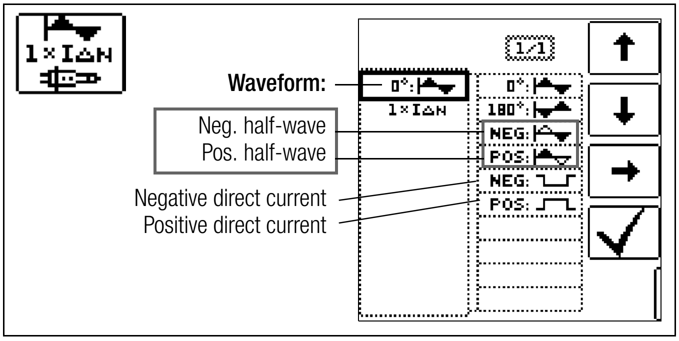
12.2.4 Testing of RCCBs which are Suitable for Pulsating DC Residual Current

In this case, RCCBs can be tested with either positive or negative half-waves. The standard calls for tripping at 1.4 times nominal current.

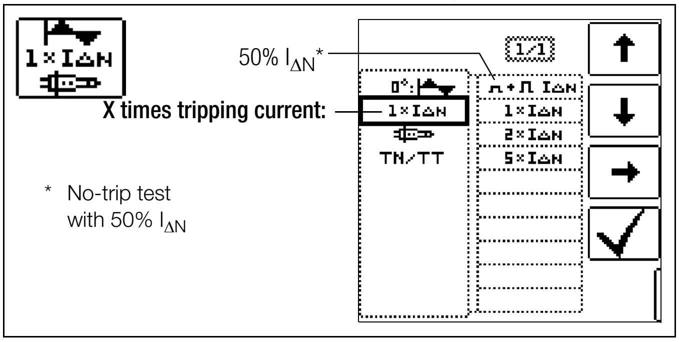
Select Measuring Function



Set Parameter – Positive or Negative Half-Wave

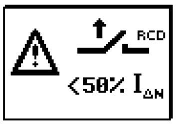


Set Parameter – Test With and Without “No-Trip Test”



* No-trip test
with 50% $I_{\Delta N}$

No-Trip Test
If, during the no-trip test which lasts for 1 second, the RCD trips too early at 50% $I_{\Delta N}$, i.e. before the actual tripping test starts, the pop-up window shown at the right appears.



Note
The following restrictions apply to the selection of tripping current multiples relative to nominal current:
500 mA: double and five-fold nominal current is not possible in this case.

Note
According to DIN EN 50178 (VDE 160), only type B RCCBs (AC-DC sensitive) can be used for equipment with > 4 kVA, which is capable of generating smooth DC residual current (e.g. frequency converters).
Tests with pulsating DC fault current only are not suitable for these RCCBs. Testing must also be conducted with smooth DC residual current in this case.

Note
Measurement is performed with positive and negative half-waves for testing RCCBs during manufacturing. If a circuit is charged with pulsating direct current, the function of the RCCB can be executed with this test in order to assure that the RCCB is not saturated by the pulsating direct current so that it no longer trips.

12.3 Testing of Special RCDs

12.3.1 Systems with Type RCD-S Selective RCCBs

Selective RCCBs are used in systems which include two series connected RCCBs which are not tripped simultaneously in the event of a fault. These selective RCCBs demonstrate delayed response characteristics and are identified with the S symbol.

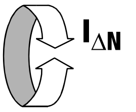
Measuring Method

The same measuring method is used as for standard RCCBs (see sections 12.1 on page 45 and 12.2.1 on page 47).

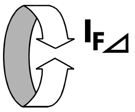
If selective RCDs are used, earthing resistance may not exceed half of the value for standard RCCBs.

For this reason, the instrument displays twice the measured value for touch voltage.

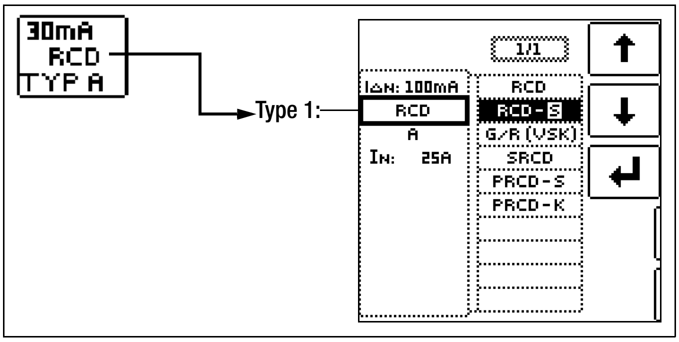
Select Measuring Function



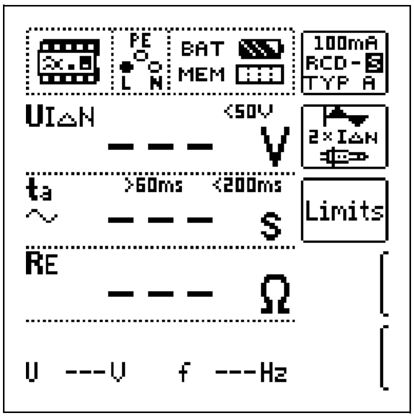
or



Set Parameter – Selective



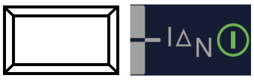
Start Measurement

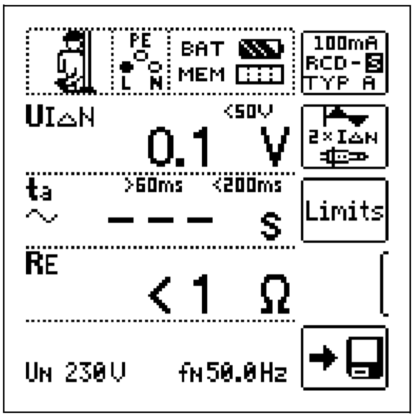


Tripping Test

- ➪ Press the $I_{\Delta N}$ key. The RCCB is tripped. Blinking bars appear at the display panel, after which time to trip t_A and earthing resistance R_E are displayed.

The tripping test need only be performed at one measuring point for each RCCB.





Note

Selective RCDs demonstrate delayed response characteristics. Tripping performance is briefly influenced (up to 30 s) due to pre-loading during measurement of touch voltage. In order to eliminate pre-charging caused by the measurement of touch voltage, a waiting period must be observed prior to the tripping test. After the measuring sequence has been started (tripping test), blinking bars are displayed for approximately 30 seconds. Tripping times of up to 1000 ms are permissible. The tripping test is executed immediately after once again pressing the $I_{\Delta N}$ key.

12.3.2 PRCDs with Non-Linear Type PRCD-K Elements

The PRCD-K is a portable RCD with electronic residual current evaluation laid out as an inline device which switches all poles (L, N and PE). Undervoltage tripping and protective conductor monitoring are additionally integrated into the PRCD-K.

The PRCD-K is equipped with undervoltage tripping, for which reason it has to be operated with line voltage, and measurements may only be performed in the on state (PRCD-K switches all poles).

Terminology (from DIN VDE 0661)

Portable protective devices are circuit breakers which can be connected between power consuming devices and permanently installed electrical outlets by means of standardized plug-and-socket devices.
A reusable, portable protective device is a protective device which is designed such that it can be connected to movable cables.

Please be aware that a non-linear element is usually integrated into PRCDs, which leads to immediate exceeding of the greatest permissible touch voltage during $U_{I\Delta}$ measurements ($U_{I\Delta}$ greater than 50 V).

PRCDs which do not include a non-linear element in the protective conductor must be tested in accordance with section 12.3.3 on page 51.

Objective (from DIN VDE 0661)

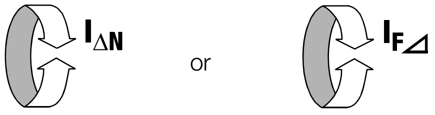
Portable residual current devices (PRCDs) serve to protect persons and property. They allow for the attainment of increased levels of protection as provided by protective measures utilized in electrical systems for the prevention of electrical shock as defined in DIN VDE 0100-410. They are to be designed such that they can be installed by means of a plug attached directly to the protective device, or by means of a plug with a short cable.

Measuring Method

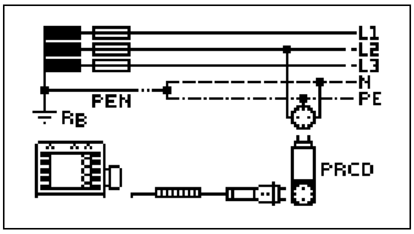
The following can be measured, depending upon the measuring method:

- Time to trip t_A: tripping test with nominal residual current $I_{\Delta N}$ (the PRCD-K must be tripped at 50% nominal current)
- Tripping current I_Δ for testing with rising residual current $I_{F◢}$

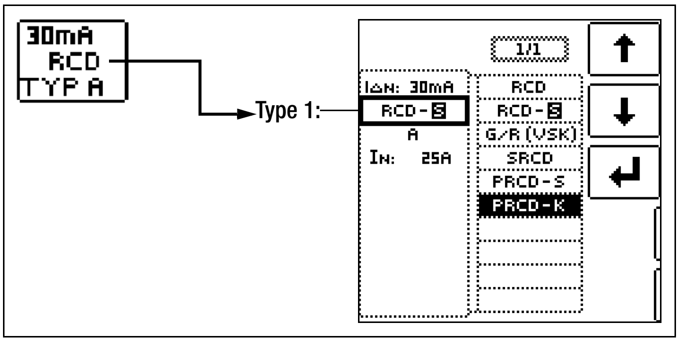
Select Measuring Function



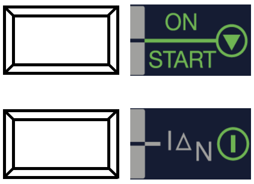
Connection

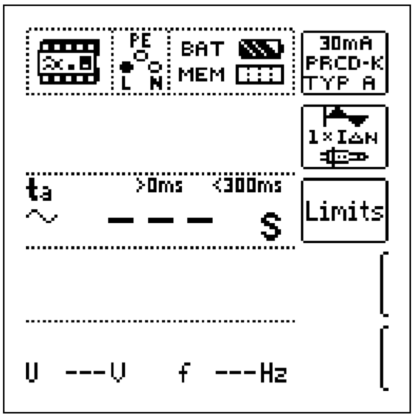


Set Parameter – PRCD with Non-Linear Elements



Start Measurement





12.3.3 SRCD, PRCD-S (SCHUKOMAT, SIDOS or comparable)

RCCBs from the SCHUKOMAT SIDOS series, as well as others which are of identical electrical design, must be tested after selecting the corresponding parameter.

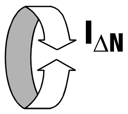
Monitoring of the PE conductor is performed for RCDs of this type. The PE conductor is monitored by the summation current transformer. If residual current flows from L to PE, tripping current is cut in half, i.e. the RCCB must be tripped at 50% nominal residual current $I_{\Delta N}$.

Whether or not PRCDs and selective RCDs are of like design can be tested by means of touch voltage $U_{I\Delta N}$ measurement. If a touch voltage $U_{I\Delta N}$ of greater than 70 V is measured at the PRCD of an otherwise error-free system, the PRCD more than likely contains a non-linear element.

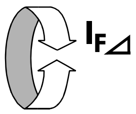
PRCD-S

The PRCD-S (portable residual current device – safety) is a special, portable, protective device with protective conductor detection or protective conductor monitoring. The device serves to protect persons from electrical accidents in the low-voltage range (130 to 1000 V). The PRCD-S must be suitable for commercial use, and is installed like an extension cable between an electrical consumer – as a rule an electrical tool – and the electrical outlet.

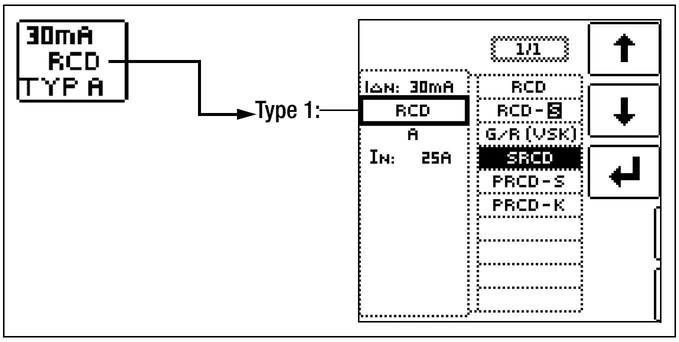
Select Measuring Function



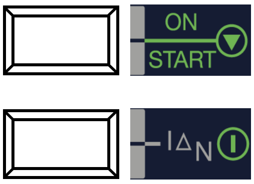
or

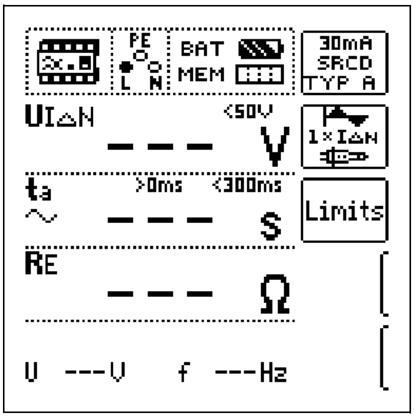


Set Parameter – SRCD / PRCD



Start Measurement



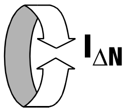


12.3.4 Type G or R RCCB

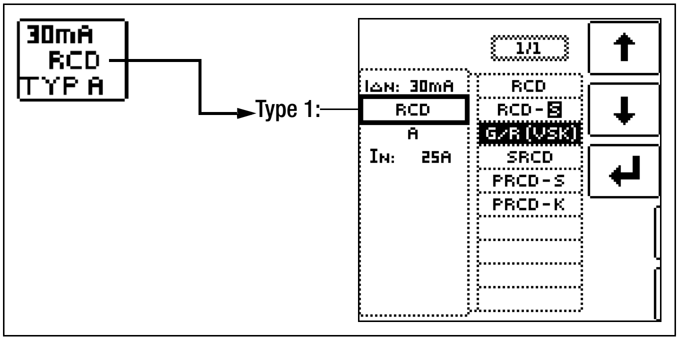
In addition to standard RCCBs and selective RCDs, the special characteristics of the type G RCCB can also be tested with the test instrument.

The type G RCCB is an Austrian specialty which complies with device standard ÖVE/ÖNORM E 8601. Erroneous tripping is minimized thanks to its greater current carrying capacity and short-term delay.

Select Measuring Function



Set Parameter – Type G/R (VSK)



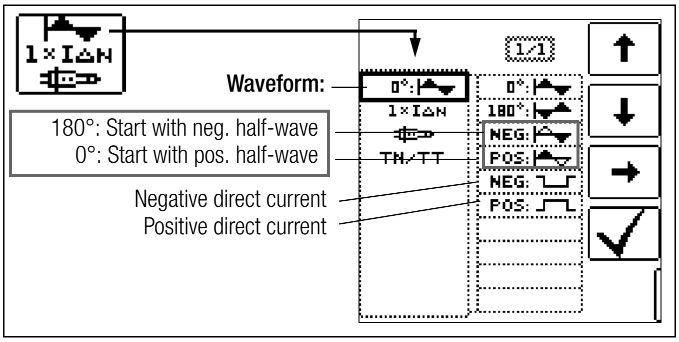
Touch voltage and time to trip can be measured in the G/R-RCD switch position.

Note

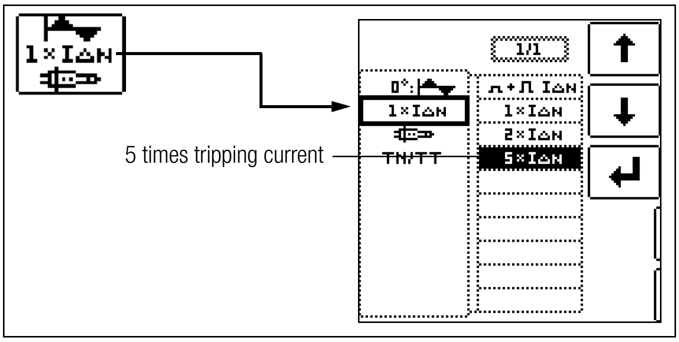
It must be observed that time to trip for type G RCCBs may be as long as 1000 ms when measurement is made at nominal residual current. Set the limit value correspondingly.

➪ Then select **5 × $I_{\Delta N}$** in the menu (this is selected automatically for the G/R setting) and repeat the tripping test beginning with the positive half-wave at 0° and the negative half-wave at 180°. The longer of the two tripping times is decisive regarding the condition of the tested RCCB.

Set Parameter – Start with Positive or Negative Half-Wave

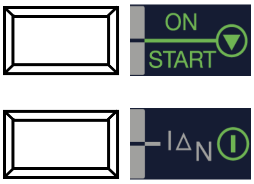


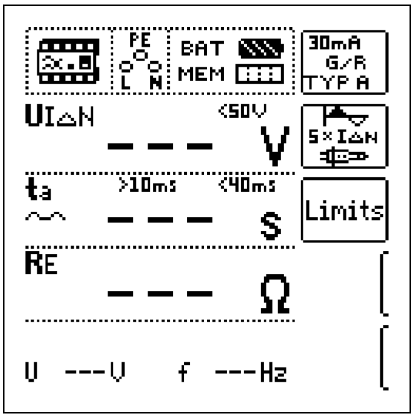
Set Parameter – 5 Times Nominal Current



Note
The following restrictions apply to the selection of tripping current multiples relative to nominal current: 500 mA: 1 ×, 2 × $I_{\Delta N}$

Start Measurement





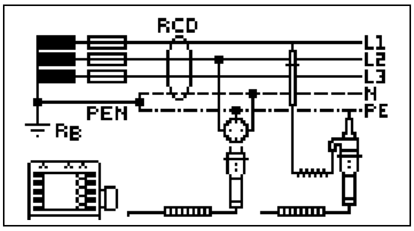
In both cases tripping time must be between 10 ms (minimum delay time for type G RCCBs!) and 40 ms.

Type G RCCBs with other nominal residual current values must be tested with the corresponding parameter setting under menu item $I_{\Delta N}$. In this case as well, the limit value must be appropriately adjusted.

Note
The RCD S parameter setting for selective RCCBs is not suitable for type G RCCBs.

12.4 Testing Residual Current Circuit Breakers in TN-S Systems

Connection



RCCBs can only be used in TN-S systems. An RCCB would not work in a TN-C system because PE is directly connected to the neutral conductor in the outlet (it does not bypass the RCCB). This means that residual current would be returned via the RCCB and would not generate any differential current, which is required in order to trip the RCCB.

As a rule, the display for touch voltage is also 0.1 V, because the nominal residual current of 30 mA together with minimal loop resistance result in a very small voltage value:

$$U_{I\Delta N} = R_E \times I_{\Delta N} = 1\ \Omega \times 30\ \text{mA} = 30\ \text{mV} = 0.03\ \text{V}$$

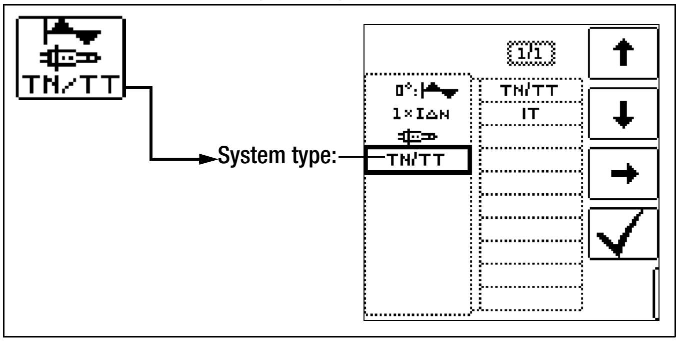
12.5 Testing of RCD Protection in IT Systems with High Cable Capacitance (e.g. In Norway)

The desired system type (TN/TT or IT) can be selected for RCD test type $U_{I\Delta N}$ ($I_{\Delta N}$, t_a), and for earthing measurement (R_E).

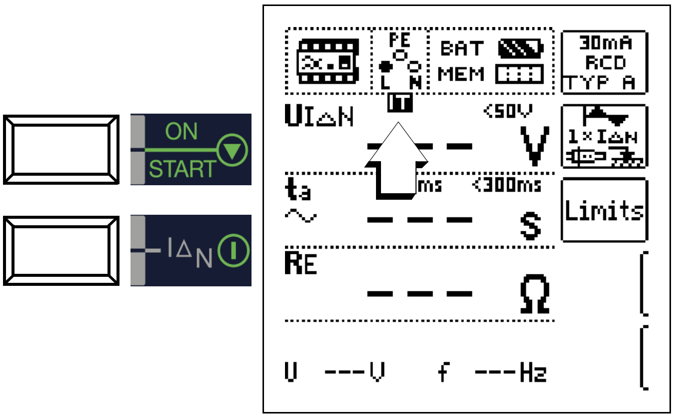
A probe is absolutely essential for measurement in IT systems, because touch voltage $U_{I\Delta N}$ which occurs in these systems cannot otherwise be measured.

After selecting the IT system setting, connection with probe is selected automatically.

Set Parameter – Select System Type



Start Measurement

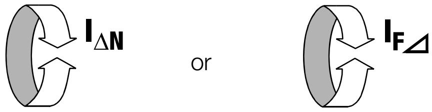


12.6 Testing of 6 mA Residual Current Devices RDC-DD/RCMB (RDC-DD: PROFITEST MXTRA and PROFITEST MTECH+ only)

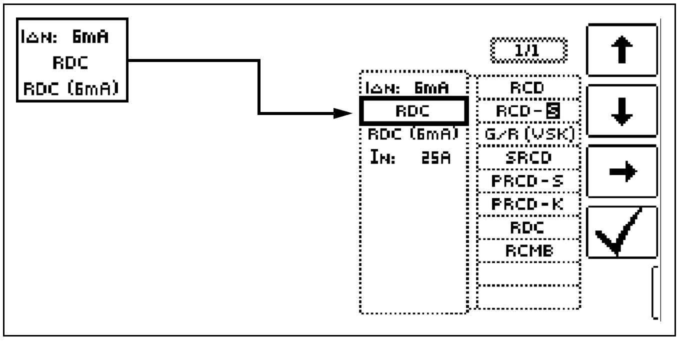
DIN VDE 0100-722 (Requirements for special installations or locations – Supplies for electric vehicles) specifies that all outlets for charging electric vehicles must be protected by a separate residual current device (RCD).

Furthermore, additional protection is required for multiphase charging with smooth DC fault current. Either a type B RCD, an RDC-DD (residual direct current detecting device) or an RCMB (residual current monitoring module) can be used to this end.

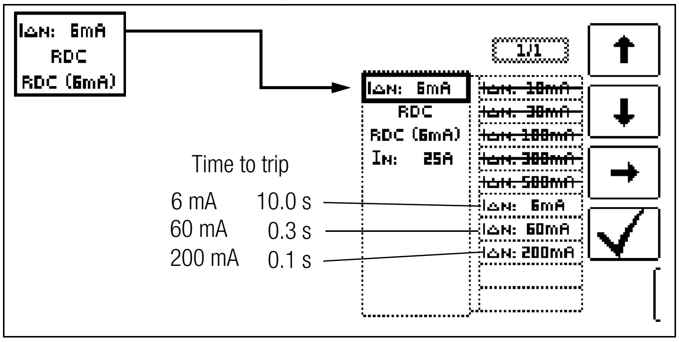
Select Measuring Function



Set Parameter – Type RDC



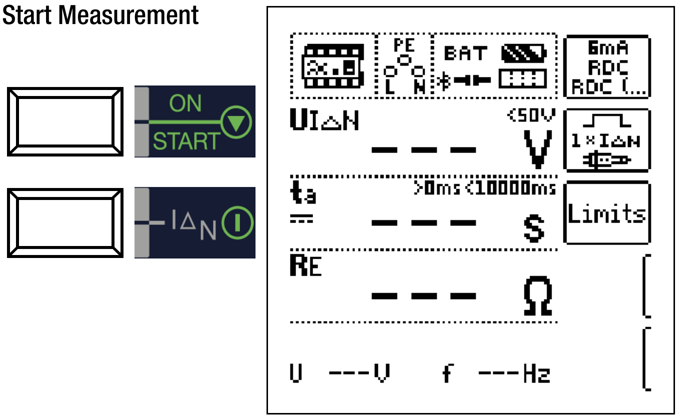
Set Parameter – Time to Trip



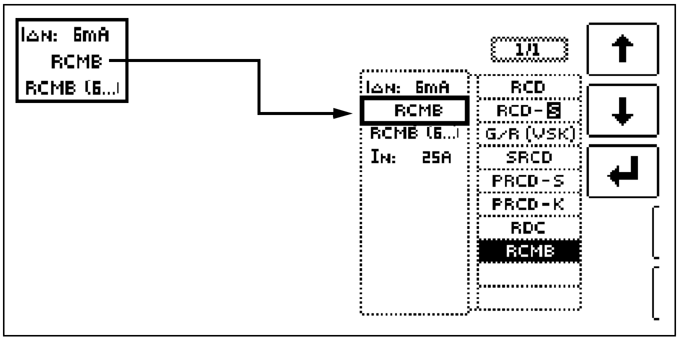
Note

The RDC-DD is tested with nominal residual currents of 6 to 200 mA.

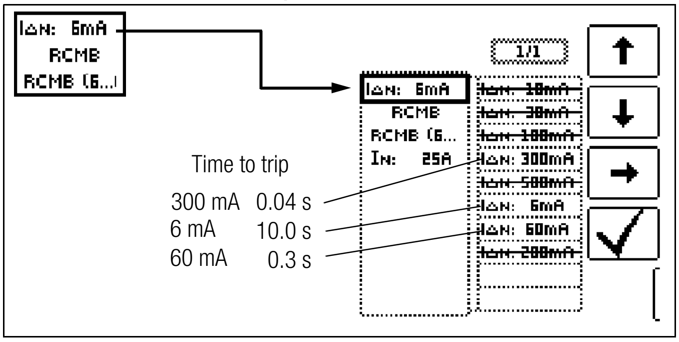
Start Measurement



Set Parameter – Type RCMB



Set Parameter – Time to Trip



Time to trip

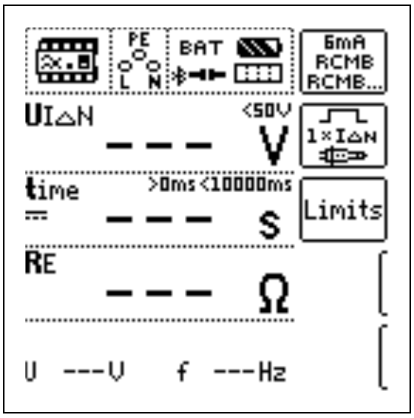
Note
The RCMB is tested with nominal residual currents of 6 to 300 mA.

Start Measurement



13 Testing of Breaking Requirements for Overcurrent Protective Devices, Measurement of Loop Impedance and Determination of Short-Circuit Current (ZL-PE and I_{SC} Functions)

Testing of overcurrent protective devices includes visual inspection and measurement.

Measuring Method

Loop impedance Z_{L-PE} is measured and short-circuit current I_{SC} is ascertained in order to determine if the breaking requirements for protective devices have been fulfilled.

Loop impedance is the resistance within the current loop (utility station – phase conductor – protective conductor) when a short-circuit to an exposed conductive part occurs (conductive connection between phase conductor and protective conductor). Short-circuit current magnitude is determined by the loop impedance value. Short-circuit current I_{SC} may not fall below a predetermined value set forth by IEC 60364, so that reliable breaking of the protective device (fuse, automatic circuit breaker) is assured.

The measured loop impedance value must therefore be less than the maximum permissible value.

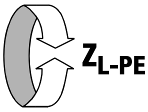
Tables containing permissible display values for loop impedance and minimum short-circuit current display values for ampere ratings for various fuses and circuit breakers can be found in the help texts and in section 25 from page 102. Maximum device error in accordance with IEC 61557 / EN 61557 has been taken into consideration in these tables. See also section 13.2.

In order to measure loop impedance Z_{L-PE}, the instrument uses a test current of 3.7 to 7 A (60 to 550 V) depending on line voltage and line frequency. At 16 Hz, The test has a duration of no more than 1200 ms.

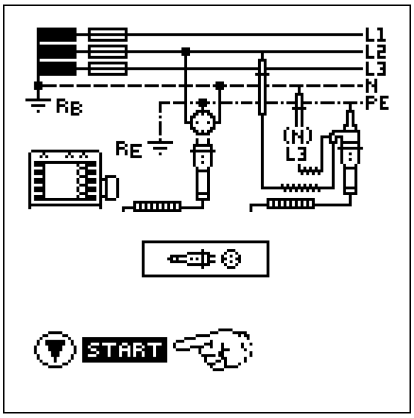
If the limit value for touch voltage is exceeded during this measurement process (> 50 V), safety shutdown occurs for Germany (65 V applies for Austria – standard: ÖVE/ÖNORM E 8001-1 section 5.3).
The shutdown value can be adjusted within a range of 25 to 65 V (see section 10.8).

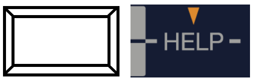
The test instrument calculates short-circuit current I_{SC} based on measured loop impedance Z_{L-PE} and line voltage. Short-circuit current calculation is made with reference to nominal line voltage for line voltages which lie within the nominal ranges for 120, 230 and 400 V systems. This also applies between phases L-L at 500 V. If line voltage does not lie within these nominal ranges, the instrument calculates short-circuit current I_{SC} based upon prevailing line voltage and measured loop impedance Z_{L-PE}.

Select Measuring Function

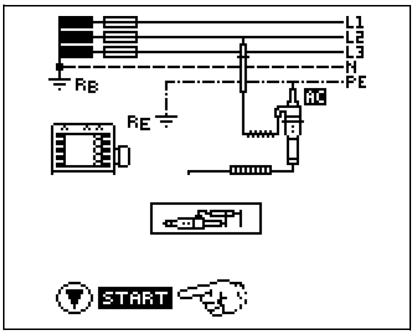


Connection
Schuko / 3-Pole Adapter





Connection
2-Pole Adapter



Note
Loop impedance should be measured for each electrical circuit at the farthest point, in order to ascertain maximum loop impedance for the system.

Note
Observe national regulations, e.g. the necessity of conducting measurements without regard for RCCBs in Austria.

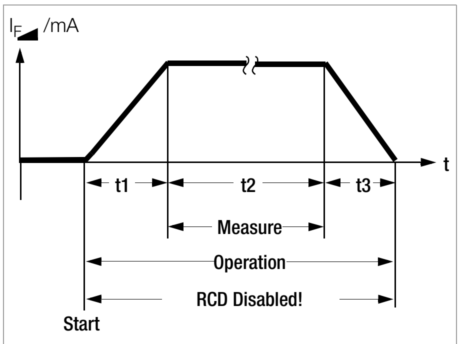
3-Phase Connections

Measurement of loop impedance to earth must be performed at all three phase conductors (L1, L2, and L3) for the testing of overcurrent protective devices at three phase outlets.

13.1 Measurements with Suppression of RCD Tripping (PROFITEST MTECH+, PROFITEST MXTRA only)

The test instruments make it possible to measure loop impedance in TN systems with type A ▨, F ▨ ▨ and AC ▨ RCCBs (10, 30, 100, 300, 500 mA nominal residual current).

The test instrument generates a direct current to this end, which saturates the RCCB's magnetic circuit.
The test instrument then superimposes a measuring current which only demonstrates half-waves of like polarity. The RCCB is no longer capable of detecting this measuring current and is consequently not tripped during measurement.



Suppression of RCCB tripping for RCCBs which are sensitive to pulsed current ▨

A four conductor measuring cable is used between the instrument and the test plug. Cable and measuring adapter resistance is automatically compensated during measurement and does not affect measurement results.

Note
Loop impedance measurement in accordance with the procedure for the suppression of RCCB tripping is only possible with type A and F RCDs.

Note
Bias Magnetization
Only AC measurements can be performed with the 2-pole adapter. Suppression of RCD tripping by means of bias magnetization with direct current is only possible via a country-specific plug insert, e.g. SCHUKO, or the 3-pole adapter (neutral conductor N required).

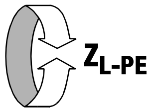
13.1.1 Measurement with Positive Half-Waves (PROFITEST MTECH+, PROFITEST MXTRA only)

Measurement by means of half-waves plus direct current makes it possible to measure loop impedance in systems which are equipped with RCCBs.

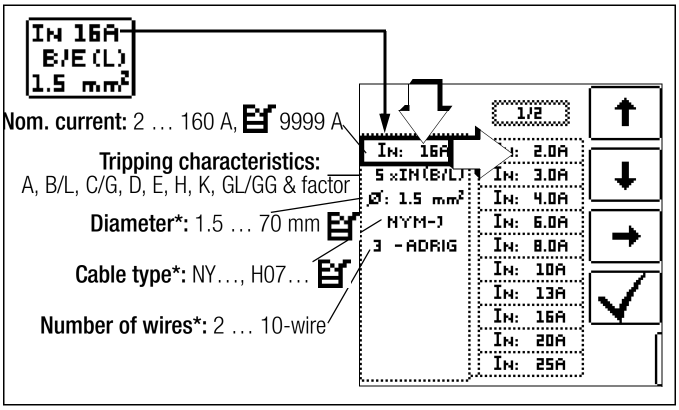
In the case of DC measurement with half-waves, selection can be made between two variants:

DC-L:	Reduced bias current but faster measurement as a result
DC-H:	Higher bias current providing more reliability with regard to non-tripping of the RCD

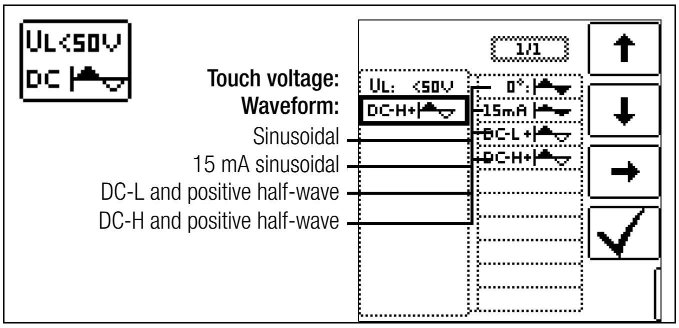
Select Measuring Function



Set Parameters



* Parameters used for report generation and do not influence the measurement



Sinusoidal (full-wave)	Setting for circuit without RCD

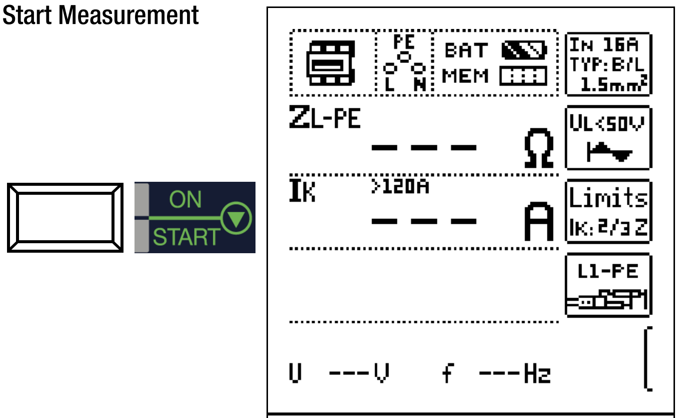
Note

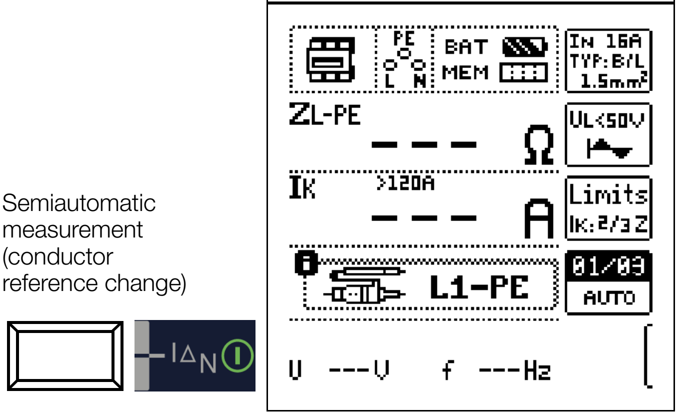
Selecting the test probe, as well as **Lx-PE** reference or **AUTO**, is only relevant with regard to report generation.

See also section 10.9 regarding the **AUTO** parameter.

Start Measurement

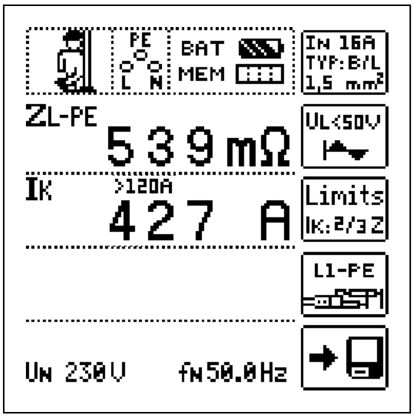


Semiautomatic measurement (conductor reference change)



13.2 Evaluation of Measured Values

The maximum permissible loop impedance Z_{L-PE} which may be displayed after allowance has been made for the instrument's maximum measuring and intrinsic uncertainties (under normal measuring conditions) can be determined with the help of Table 1 on page 102. Intermediate values can be interpolated.



The maximum permissible nominal current for the protective device (fuse or circuit breaker) for a line voltage of 230 V after allowance has been made for maximum measuring error can be determined with the help of Table 6 on page 103 based on measured short-circuit current (corresponds to IEC 60364-6).

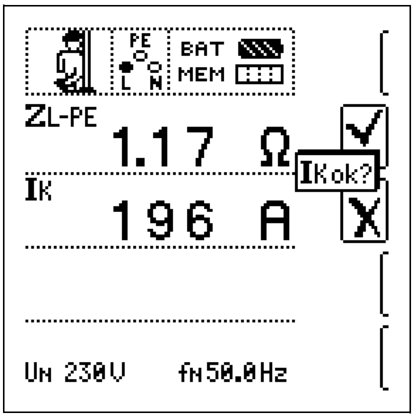
Special Case: Suppressing Display of the Limit Value

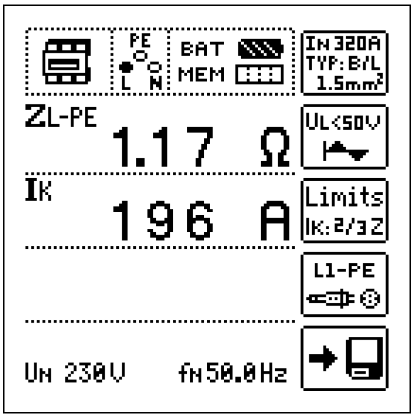
The limit value cannot be ascertained. The inspector is prompted to evaluate the measured values himself, and to acknowledge or reject them with the help of the softkeys.

Measurement passed: ✓. key

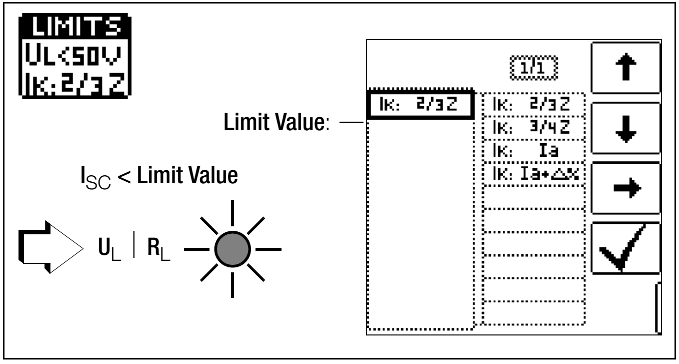
Measurement failed: ✗ key

The measured value can only be saved after it has been evaluated.





13.3 Settings for Calculating Short-Circuit Current – Parameter I_{SC}



Short-circuit current I_{SC} is used to test shutdown by means of an overcurrent protective device. In order for an overcurrent protective device to be tripped on time, short-circuit current I_{SC} must be greater than tripping current Ia (see table 6 in section 25.1). The variants which can be selected with the “Limits” key have the following meanings:

I_{SC}:	I_a	The measured value displayed for I_{SC} is used without any correction to calculate $Z_{L\text{-}PE}$.
I_{SC}:	$I_a+\Delta\%$	The measured value displayed for $Z_{L\text{-}PE}$ is corrected by an amount equal to the test instrument’s measuring and intrinsic uncertainties in order to calculate I_{SC}.
I_{SC}:	2/3 Z	In order to calculate I_{SC}, the measured value displayed for $Z_{L\text{-}PE}$ is corrected by an amount corresponding to all possible deviations (these are defined in detail by IEC 60364-6 as $Z_{s(m)} \leq 2/3 \times U_0/I_a$).
I_{SC}:	3/4 Z	$Z_{s(m)} \leq 3/4 \times U_0/I_a$

Z	Loop impedance
I_{SC}	Short-circuit current
U	Momentary voltage at the test probes, “U_N” is displayed if $U_{max.}$ deviates from nominal voltage by 10%
f	Frequency of the applied voltage, “f_N” is displayed if frequency f max. deviates from nominal frequency by 1%
I_a	Tripping current (see data sheet for circuit breakers / fuses)
Δ%	Test instrument intrinsic error

14 Measuring Supply Impedance (Z_{L-N} Function)

Measuring Method (internal line resistance measurement)

Supply impedance Z_{L-N} is measured by means of the same method used for loop impedance Z_{L-PE} (see section 13 on page 55). However, the current loop is completed via neutral conductor N rather than protective conductor PE as is the case with loop impedance measurement.

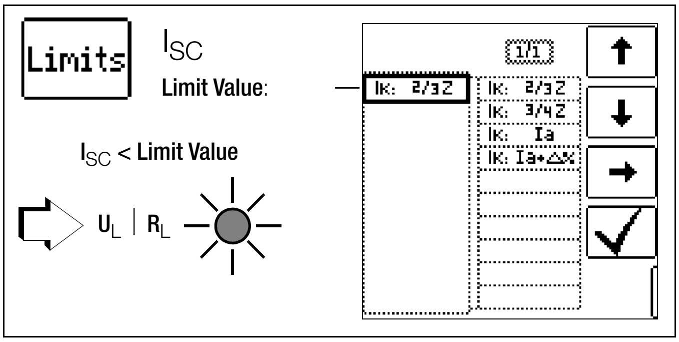
L-PE relationships are not possible here.

Settings for Calculating Short-Circuit Current – Parameter I_{SC}



I_{SC}

Limit Value:

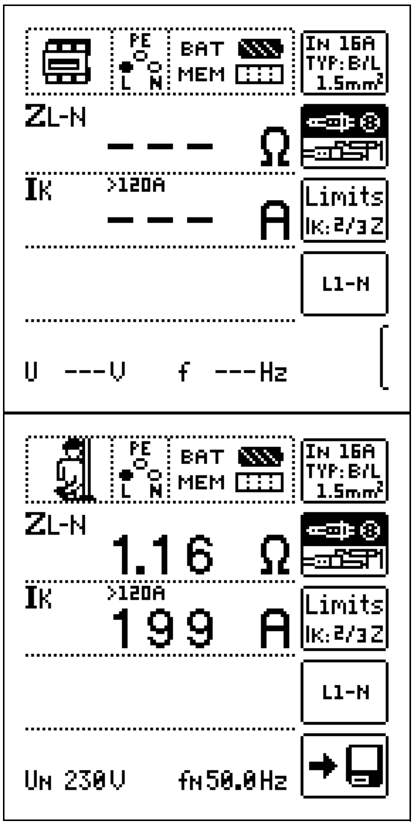
I_{SC} < **Limit Value**

Short-circuit current I_{SC} is used to test shutdown by means of an overcurrent protective device. In order for an overcurrent protective device to be tripped on time, short-circuit current I_{SC} must be greater than tripping current I_a (see table 6 in section 25.1). The variants which can be selected with the “Limits” key have the following meanings:

I_{SC}:	I_a	The measured value displayed for I_{SC} is used without any correction to calculate Z_{L-N}.
I_{SC}:	$I_a+\Delta\%$	The measured value displayed for Z_{L-N} is corrected by an amount equal to the test instrument’s measuring and intrinsic uncertainties in order to calculate I_{SC}.
I_{SC}:	2/3 Z	In order to calculate I_{SC}, the measured value displayed for Z_{L-N} is corrected by an amount corresponding to all possible deviations (these are defined in detail by IEC 60364-6 as $Z_{s(m)} \leq 2/3 \times U_0/I_a$).
I_{SC}:	3/4 Z	$Z_{s(m)} \leq 3/4 \times U_0/I_a$

Z	Loop impedance
I_{SC}	Short-circuit current
U	Momentary voltage at the test probes, “U_N” is displayed if $U_{max.}$ deviates from nominal voltage by 10%
f	Frequency of the applied voltage, “fN” is displayed if frequency $f_{max.}$ deviates from nominal frequency by 1%
I_a	Tripping current (see data sheet for circuit breakers / fuses)
Δ%	Test instrument intrinsic error

Start Measurement



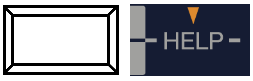
Display of U_{L-N} (U_N / f_N)

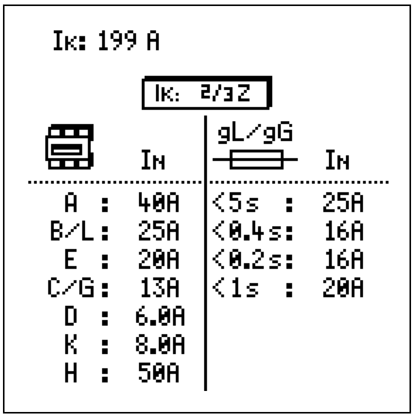
If the measured voltage value lies within a range of ±10% of the respective nominal line voltage of 120, 230 or 400 V, the respectively corresponding nominal line voltage is displayed. In the case of measured values outside of the ±10% tolerance, the actual measured value is displayed.

Displaying the Fuse Table

After measurement has been performed, permissible fuse types can be displayed by pressing the **HELP** key.

The table shows maximum permissible nominal current dependent on fuse type and breaking requirements.





Ik: 199 A

IK: 2/3Z

	IN	gL/gG	IN
A :	40A	<5s :	25A
B/L :	25A	<0.4s :	16A
E :	20A	<0.2s :	16A
C/G :	13A	<1s :	20A
D :	6.0A		
K :	8.0A		
H :	50A		

Key: I_a = breaking current, I_{SC} = short-circuit current, I_N = nominal current, t_a = time to trip

15 Earthing Resistance Measurement (Function R_E)

Earthing resistance R_E is important for automatic shutdown in system segments. It must have a low value in order to assure that high short-circuit current flows and the system is shut down reliably by the RCCB in the event of a fault.

Test Setup

Earthing resistance (R_E) is the sum of the earth electrode's dissipation resistance and earth conductor resistance. Earthing resistance is measured by applying an alternating current via the earth conductor, the earth electrode and dissipation resistance. This current, as well as voltage between the earth electrode and a probe, are measured.

The probe is connected to the probe connector socket (17) with a 4 mm contact protected plug.

Direct measurement with probe (mains powered earthing measurement)

Direct measurement of earthing resistance R_E is only possible within a measuring circuit which includes a probe. However, this means that the probe and reference earth must be of like potential, i.e. that they are positioned outside of the potential gradient area. The distance between the earth electrode and the probe should be at least 20 m.

Measurement without probe (mains powered earthing measurement)

In many cases, especially in extremely built-up areas, it's difficult, or even impossible, to set a measuring probe. In such cases, earthing resistance can be measured without a probe. In this case, however, the resistance values for the operational earth electrode R_B and phase conductor L are also included in the measurement results.

Measuring method (with probe) (mains powered earthing measurement)

The instrument measures earthing resistance R_E by means of the ammeter-voltmeter test.

Resistance R_E is calculated from the quotient of voltage U_E and current I_E where U_E is between the earth electrode and the probe. The test current which is applied to earthing resistance is controlled by the instrument (see section 5.5, "Technical Data", on page 10 for pertinent values).

A voltage drop is generated which is proportional to earthing resistance.

☞ **Note**

Measurement cable and measuring adapter resistance are compensated automatically during measurement and have no effect on measurement results.

If dangerous touch voltages occur during measurement (> 50 V), the measurement is interrupted and safety shutdown occurs.

Probe resistance does not affect measurement results and may be as high as 50 kΩ.

⚠ **Attention!**

The probe is part of the measuring circuit and may carry a current of up to 3.5 mA in accordance with IEC 61557 / EN 61557.

Measurement with or without earth electrode voltage depending upon entered parameters and the selected type of connection:

RANGE	Connection	Measuring Functions
xx Ω / xx kΩ	2-P	No probe measurement No U_E measurement
10 Ω / U_E *	3-P	Probe measurement activated U_E is measured
xx Ω / xx kΩ *	3-P	Probe measurement activated No U_E measurement
	SEL 3-P	Clamp measurement activated No U_E measurement

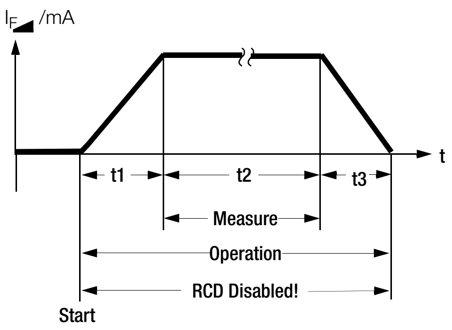
* This parameter results in automatic selection of probe connection.

Measuring method with suppression of RCD tripping (mains powered earthing measurement) (PROFITEST MTECH+, PROFITEST MXTRA only)

The test instrument makes it possible to measure earthing resistance in TN systems with type A ∿, F ∿ ⎍⎍ and AC ∿ RCCBs (10, 30, 100, 300, 500 mA nominal residual current).

The test instrument generates a direct current to this end, which saturates the RCCB's magnetic circuit.

The test instrument then superimposes a measuring current which only demonstrates half-waves of like polarity. The RCCB is no longer capable of detecting this measuring current, and is consequently not tripped during measurement.



Suppression of RCCB tripping for RCCBs which are sensitive to pulsed current ∿

A four conductor measuring cable is used between the instrument and the test plug. Cable and measuring adapter resistance is automatically compensated during measurement and does not affect measurement results.

☞ **Note**

Bias Magnetization

Only AC measurements can be performed with the 2-pole adapter. Suppression of RCD tripping by means of bias magnetization with direct current is only possible via a country-specific plug insert, e.g. SCHUKO, or the 3-pole adapter (neutral conductor N required).

Limit Values

Earthing resistance (earth coupling resistance) is determined primarily by the electrode's contact surface and the conductivity of the surrounding earth.

The specified limit value depends on the type of electrical system and its shutdown conditions in consideration of maximum touch voltage.

Evaluating Measured Values

The maximum permissible displayed resistance values which assure that the required earthing resistance is not exceeded, and for which maximum device operating error has already been taken into consideration (at nominal conditions of use), can be determined with the help of Table 2 on page 102. Intermediate values can be interpolated.

15.1 Earthing Resistance Measurement – Mains Powered

The following types of measurement and connection are possible:

- 2-P 2-wire measurement via 2-pole adapter
- 2-P 2-pole measurement via earthing contact plug (not possible in IT systems)
- 3-P 3-wire measurement via 2-pole adapter and probe
- SEL 3-P Selective measurement: 2-pole measurement with probe and current clamp sensor

❑ **Connection:** 3-pole, 4-pole, selective, 2-clamp, ρ_E (Rho)

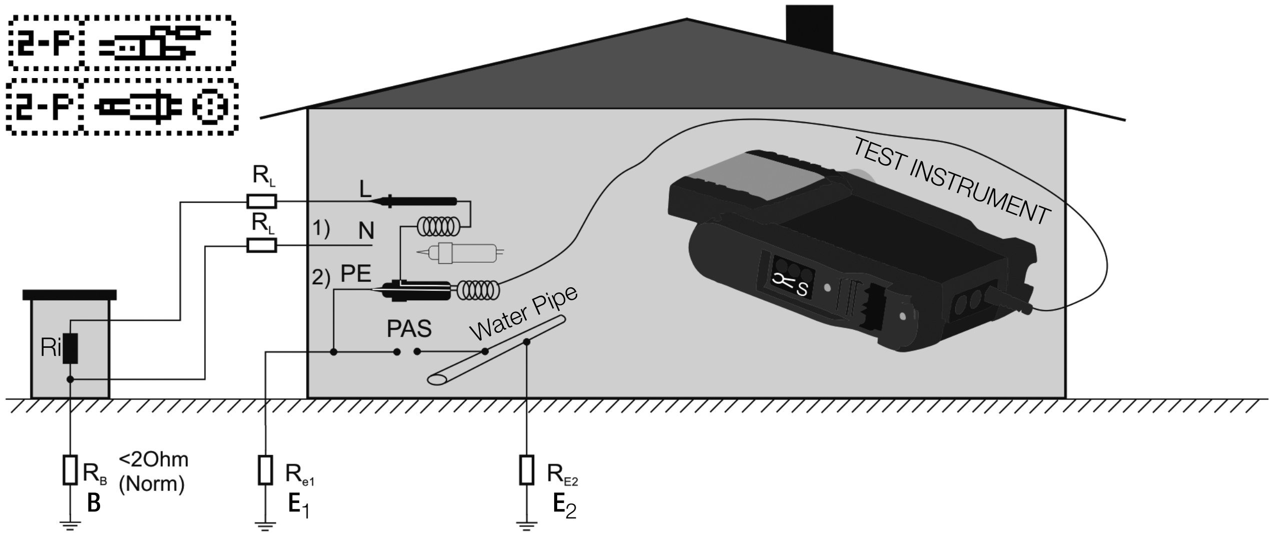
❑ **Distance d (for measuring ρ_E):** xx m

See section 15.7 through section 15.11 regarding advisable parameters for the respective measurement and connection types.

Performing Measurements

See section 15.7 through section 15.11.

15.3 Earthing Resistance, Mains Powered – 2-Pole Measurement with 2-Pole Adapter or Country-Specific Plug (Schuko) without Probe



Key

R_B	Operational earth electrode
R_E	Earthing resistance
R_i	Internal resistance
R_X	Earthing resistance through equipotential bonding systems
R_S	Probe resistance
PAS	Equipotential bonding busbar
RE⏚	Overall earthing resistance (R_{E1}//R_{E2}//water pipe)

In the event that it's impossible to set a probe, earthing resistance can be estimated by means of an "earth loop resistance measurement" without probe.

The measurement is performed exactly as described in section 15.4, "Earthing Resistance Measurement. Mains Powered – 3-Pole Measurement: 2-Pole Adapter with Probe", on page 63. However, no probe is connected to the probe connector socket (17).

The resistance value R_{ELoop} obtained with this measuring method also includes operational earth electrode resistance R_B and resistance at phase conductor L. These values must be subtracted from the measured value in order to determine earthing resistance.

If conductors of equal cross section are assumed (phase conductor L and neutral conductor N), phase conductor resistance is half as great as supply impedance Z_{L-N} (phase conductor + neutral conductor). Supply impedance can be measured as described in section 14 from page 58. In accordance with IEC 60364, the operational earth electrode R_B must lie within a range of "0 Ω to 2 Ω".

1) Measurement: Z_{LN} amounts to $R_i = 2 \times R_L$
2) Measurement: Z_{L-PE} amounts to R_{ELoop}
3) Calculation: R_{E1} amounts to $Z_{L-PE} - ½ \times Z_{L-N}$, where $R_B = 0$

The value for operational earth conductor resistance R_B should be ignored in the calculation of earthing resistance, because it's generally unknown.

The calculated earthing resistance thus includes operational earth conductor resistance as a safety factor.

If the 2-P parameter is selected, steps 1 through 3 are executed automatically by the test instrument.

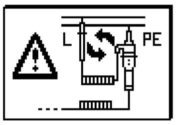
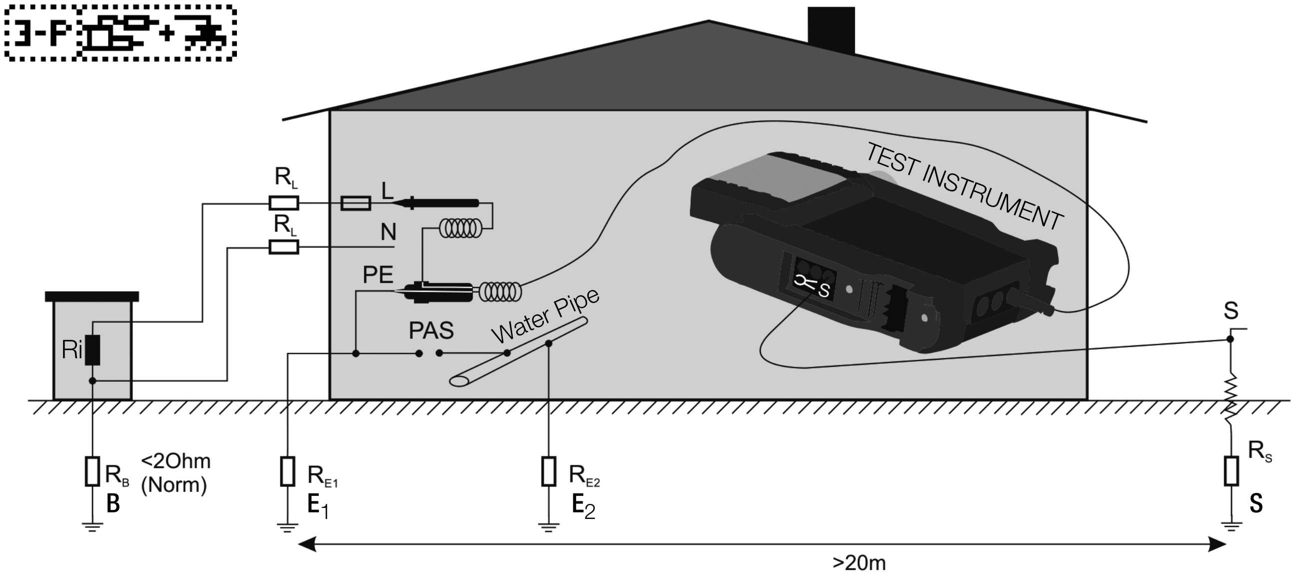
Note

The following diagram appears if the 2-pole adapter is connected incorrectly.



15.5 Earthing Resistance Measurement, Mains Powered – Measuring Earth Electrode Potential (U_E Function)



This measurement is only possible with a probe (see section 15.4). Earth electrode potential U_E is the voltage which occurs at the earth electrode between the earth electrode terminal and reference earth if a short-circuit occurs between the phase conductor and the earth electrode. The measurement of earth electrode potential is required by Swiss standard NIV/NIN SEV 1000.

Measuring Method

In order to determine earth electrode potential the instrument first measures earth electrode loop resistance R_{ELoop}, and immediately thereafter earthing resistance R_E. The instrument stores both values and then calculates earth electrode potential with the following equation:

$$U_E = \frac{U_N \cdot R_E}{R_{ELoop}}$$

The calculated value is displayed at the display panel.

- ❑ **Current clamp sensor transformation ratio:** see table below

Set Parameters at Current Clamp Sensor

- ❑ **Current clamp sensor measuring range:** see table below

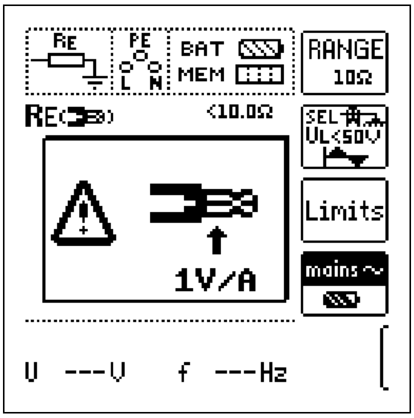
Select Measuring Range at the Current Clamp Sensor

Test Instrument	METRAFLEX P300 Clamp		Test Instrument
Parameters Transformation Ratio	Switches	Measuring Range	Measuring Range
1:1 1 V / A	3 A (1 V/A)	**3 A**	0.5 … 100 mA
01:10 100 mV / A	30 A (100 mV/A)	**30 A**	5 … 999 mA
1:100 10 mV / A	300 A (10 mV/A)	**300 A**	0.05 … 10 A

Important Instructions for Use of the Current Clamp Sensor

- Use only the METRAFLEX P300 or the Z3512A current clamp sensor for this measurement.
- Read and adhere to the operating instructions for the METRAFLEX P300 current clamp sensor, as well as the safety precautions included therein.
- Observe direction of current flow (see arrow on the current clamp sensor).
- Use the clamp in the permanently connected state. The sensor may not be moved during measurement.
- The current clamp sensor may only be used at an adequate distance from powerful extraneous fields.
- Before use, always inspect the electronics housing, the connector cable and the current sensor for damage.
- In order to prevent electric shock, keep the surface of the METRAFLEX clean and free of contamination.
- Before use, make sure that the flexible current sensor, the connector cable and the electronics housing are dry.

Start Measurement



In the event that you have changed the transformation ratio at the test instrument, a pop-up window appears indicating that this new setting also has to be entered to the connected current clamp sensor.

Note

Note regarding currently selected transformation ratio at the tester

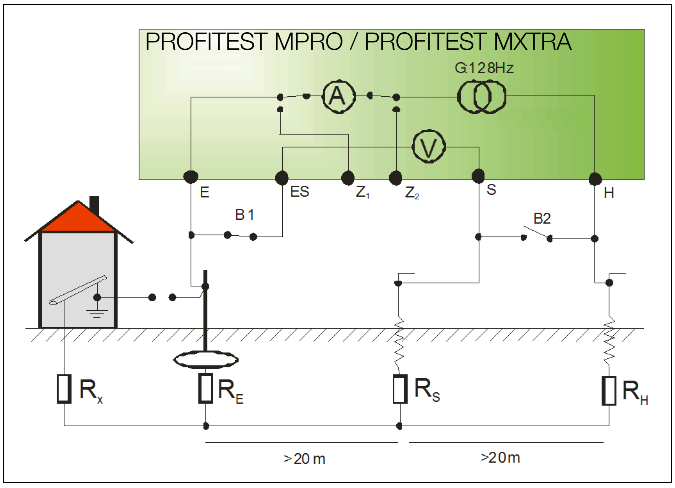
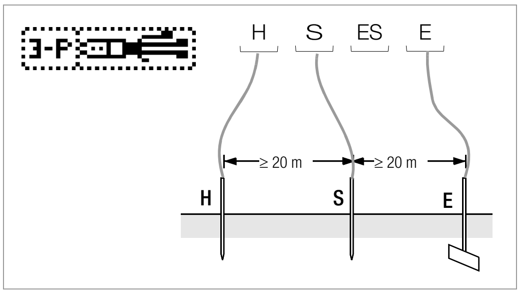
15.7 Earthing Resistance Measurement, Battery Powered, “Battery Mode” – 3-Pole (PROFITEST MPRO & PROFITEST MXTRA only)

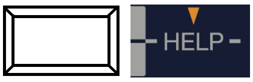
3-Wire Method

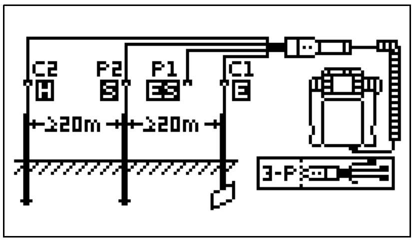


Earthing Resistance Measurement According to the 3-Wire Method



Connection





- ➪ Position the spikes for the probe and the auxiliary electrode at least 20, respectively 40 meters from the electrode (see figure above).
- ➪ Make sure that no excessively high contact resistances occur between the probe and the ground.
- ➪ Attach the PRO-RE adapter (Z501S) to the test plug.
- ➪ Connect the probe, the auxiliary electrode and the electrode via the 4 mm banana plug sockets at the PRO-RE adapter. In doing so, observe labeling on the banana plug sockets. Terminal ES/P1 is not connected.

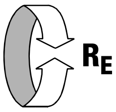
The resistance of the measurement cable to the earth electrode is incorporated directly into the measurement results.

In order to keep error caused by measurement cable resistance as small as possible, a short connector cable with large cross-section should be used between the earth electrode and terminal **E** for this measuring method.

☞ **Note**

The measurement cables must be well insulated in order to prevent shunting. In order to keep the influence of possible coupling to a minimum, the measurement cables should not cross each other or run parallel to each other over any considerable distance.

Select Measuring Function



Select Operating Mode

Potential Gradient Area

Information regarding suitable positioning of the probe and the auxiliary earth electrode can be obtained by observing voltage characteristics ordissipation resistance in the ground.

The measuring current from the earth tester which flows via the earth electrode and the auxiliary earth electrode causes a given potential distribution in the form of a potential gradient area (cf. page 69). Resistance distribution is analogous to potential distribution.

Dissipation resistance of the earth electrode and the auxiliary earth electrode differs as a rule. The potential gradient area and the resistance gradient area are thus not symmetrical.

Dissipation Resistance of Small Scope Earth Electrodes

The arrangement of the probe and the auxiliary earth electrode are very important for correct determination of the dissipation resistance of earth electrodes.

The probe must be positioned between the earth electrode and the auxiliary earth electrode within the so-called neutral zone (reference earth) (cf. page 69).

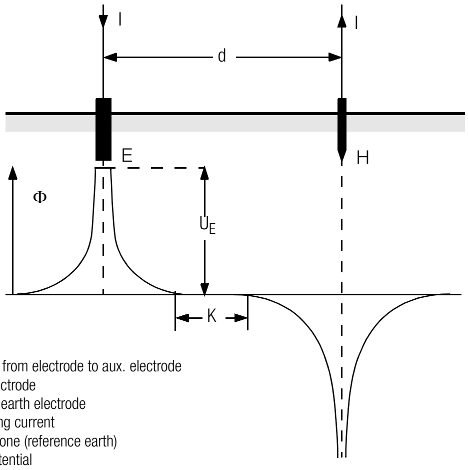
The voltage or resistance curve is thus nearly horizontal within the neutral zone.

Proceed as follows in order to select suitable probe and auxiliary earth electrode resistances:

- ➪ Drive the auxiliary earth electrode into the ground at a distance of roughly 40 meters from the earth electrode.
- ➪ Position the probe halfway between the earth electrode and the auxiliary earth electrode and determine earthing resistance.
- ➪ Reposition the probe 2 … 3 m closer to the earth electrode, and then 2 … 3 m closer to the auxiliary earth electrode and measure earthing resistance in each position.

If all 3 measurements result in the same measured value, this is the correct earthing resistance. The probe is in the neutral zone.

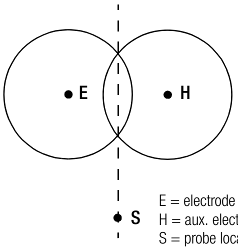
However, if the three measured values for earthing resistance differ from each other, either the probe is not located in the neutral zone, or the voltage or resistance curve is not horizontal at the point at which the probe has been inserted.



d = distance from electrode to aux. electrode
E = earth electrode
H = auxiliary earth electrode
I = measuring current
K = neutral zone (reference earth)
U_E = earth potential
R_E = U_E / I = earthing resistance
Φ = potential

Voltage Curve in Homogeneous Earth between Earth Electrode E and Auxiliary Earth Electrode H

Correct measurements can be obtained in such cases by either increasing distance between the earth electrode and the auxiliary earth electrode, or by moving the probe to the perpendicular bisector between the earth electrode and the auxiliary earth electrode (see figure below). When the probe is moved to the perpendicular bisector, its location is removed from the sphere of influence of the two potential gradient areas caused by the earth electrode and the auxiliary earth electrode.



E = electrode location
H = aux. electrode location
S = probe location

Probe Distance S Outside of the Overlapping Potential Gradient Areas on the Perpendicular Bisector of Earth Electrode E and Auxiliary Earth Electrode H

Dissipation Resistance of Large Scope Earthing Systems

Significantly large distances to the probe and the auxiliary earth electrode are required for measuring large scope earthing systems. Calculations are based on 2½ or 5 times the value of the earthing system’s largest diagonal.
Large scope earthing systems of this sort often demonstrate dissipation resistances of only a few ohms, which makes it especially important to position the measuring probe within the neutral zone. The probe and the auxiliary earth electrode should be positioned at a right angle to the direction of the earthing system’s largest linear expansion. Dissipation resistance must be kept small. If necessary, several earth spikes must be used at a distance of 1 to 2 m from each other and connected to this end.

However, in actual practice large measuring distances are frequently not possible to due difficult terrain.
If this is the case, proceed as shown in figure “Earthing Resistance Measurement for a Large Scope Earthing System” on page 69.

- Auxiliary earth electrode H is positioned as far as possible from the earthing system.
- The area between the earth electrode and the auxiliary earth electrode is sampled with the probe in equal steps of 5 meters each.
- Measured resistance values are displayed as a table, and then plotted graphically as depicted in “Earthing Resistance Measurement for a Large Scope Earthing System” on page 69. (Curve I).

If a line parallel to the abscissa is drawn through inflection point S1, this line divides the resistance curve into two parts. Measured at the ordinate, the bottom part results in sought dissipation resistance of the earth electrode $R_{A/E}$, and the top value is dissipation resistance of the auxiliary earth electrode $R_{A/H}$.
With a measurement setup of this type, dissipation resistance of the auxiliary earth electrode should be less than 100 times the dissipation resistance of the earth electrode.

In the case of resistance curves without a well-defined horizontal area, measurement should be double checked after repositioning the auxiliary earth electrode. This additional resistance curve must be entered to the first diagram with a modified abscissa scale such that the two auxiliary earth electrode locations are superimposed. The initially ascertained dissipation resistance value can be checked with inflection point S2.

Notes Regarding Measurement in Difficult Terrain

In extremely unfavorable terrain (e.g. sandy soil after a lengthy period without rain), auxiliary earth electrode and probe resistance can be reduced to permissible values by watering the ground around the auxiliary earth electrode and the probe with soda water or salt water.
If this does not suffice, several earth spikes can be parallel connected to the auxiliary earth electrode.

In mountainous terrain or in the case of very rocky subsoil where earth spikes cannot be driven into the ground, wire grates with a mesh size of 1 cm and a surface area of about 2 square meters can be used. These grates are laid flat onto the ground, are wetted with soda water or salt water and may also be weighted down with sacks full of moist earth.

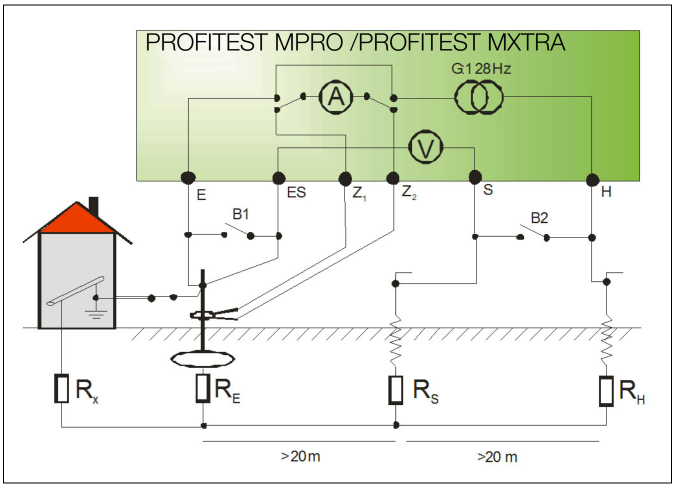
Earthing Resistance Measurement for a Large Scope Earthing System

15.9 Earthing Resistance Measurement, Battery Powered, “Battery Mode” – Selective (4-pole) with Current Clamp Sensor and PRO-RE Measuring Adapter as Accessory (PROFITEST MPRO & PROFITEST MXTRA only)

General

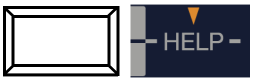


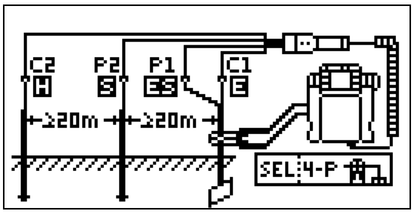
When measuring earthing resistance in systems with several parallel connected earth electrodes, total resistance of the earthing system is measured.

Two earth spikes (auxiliary earth electrode and probe) are set for this measurement. Measuring current is fed between the earth electrode and the auxiliary earth electrode and voltage drop is measured between the earth electrode and the probe.

The current clamp is positioned around the earth electrode to be measured, and thus only that portion of the measuring current which flows through the earth electrode is measured.

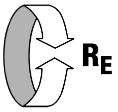
Connection





- ➪ Position the spikes for the probe and the auxiliary electrode at least 20, respectively 40 meters from the electrode (see figure above).
- ➪ Make sure that no excessively high contact resistances occur between the probe and the ground.
- ➪ Attach the PRO-RE adapter (Z501S) to the test plug.
- ➪ Connect the probes, the auxiliary electrode and the electrode via the 4 mm banana plug sockets at the PRO-RE adapter. In doing so, observe labeling on the banana plug sockets.
- ➪ Connect the Z3512A current clamp sensor to jacks (15) and (16) at the test instrument.
- ➪ Attach the current clamp sensor to the earth electrode.

Select Measuring Function



Select Operating Mode

The selected operating mode is displayed inversely:
white battery icon against black background.

Set Parameters at Tester

❏ **Measuring range:** 200 Ω

Note
After switching to selective measurement, the **AUTO** measuring range is activated automatically if a measuring range of greater than 200 Ω had been selected.

❏ **Connection type:** selective
❏ **Current clamp sensor transformer ratio:**
1:1 (1 V/A,) 1:10 (100 mV/A), 1:100 (10 mV/A)
❏ **Distance d (for measuring ρ_E):** irrelevant in this case

Set Parameters at Current Clamp Sensor

❏ **Current clamp sensor measuring range:** see table below

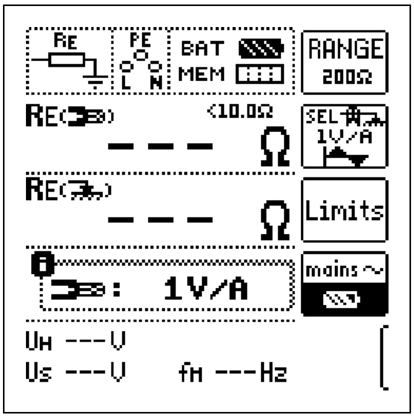
Select Measuring Range at the Current Clamp Sensor

Test Instrument	Z3512A Clamp	
Parameters Transformation Ratio	Switches	Measuring Range
1:1 1 V / A	1 A / × 1	**1 A**
01:10 100 mV / A	10 A / × 10	**10 A**
1:100 10 mV / A	100 A / × 100	**100 A**

Important Instructions for Use of the Current Clamp Sensor

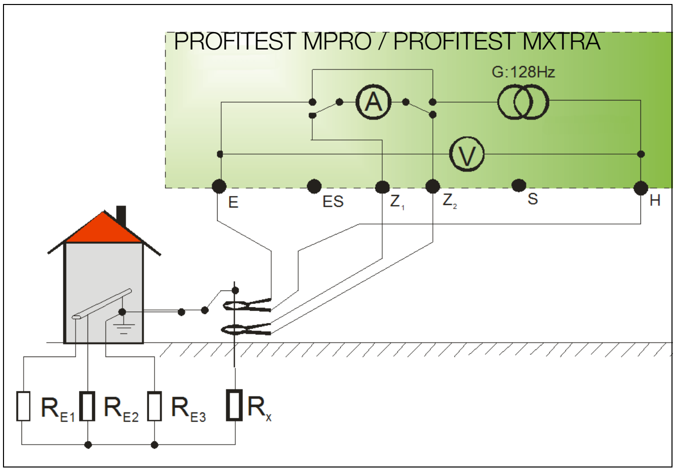
- Use only the Z3512A current clamp sensor for this measurement.
- Use the clamp in the permanently connected state. The sensor may not be moved during measurement.
- The current clamp sensor may only be used at an adequate distance from powerful extraneous fields.
- Make sure that the current clamp sensor’s connector cable is laid separate from the probe cables to the greatest possible extent.

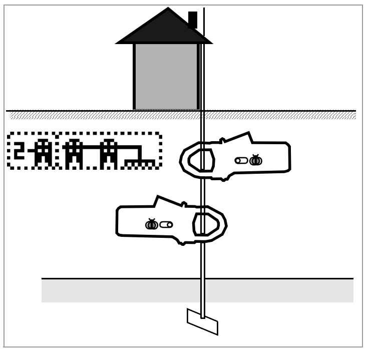
Start Measurement



15.10 Earthing Resistance Measurement, Battery Powered, “Battery Mode” – Ground Loop Measurement (with current clamp sensor and transformer, and pro-re measuring adapter as accessory) (PROFITEST MPRO & PROFITEST MXTRA only)

2-Clamp Measuring Method





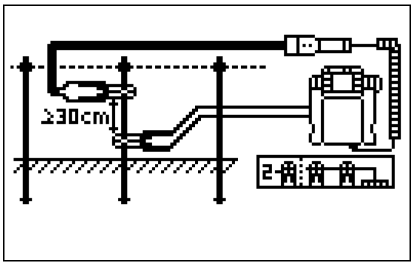
In the case of earthing systems which consist of several earth electrodes (R1 … Rx) which are connected to each other, earthing resistance of a single electrode (Rx) can be ascertained with the help of 2 current clamps without disconnecting Rx or using spikes.

This measuring method is especially well suited for buildings or systems for which probes and auxiliary earth electrodes cannot be used, or where it’s impermissible to disconnect earth electrodes.

Furthermore, this “spike-free” measurement is performed as one of three measurements for lightning protection systems, in order to determine whether or not current can be dissipated.

Figure at right:
PRO-RE/2 measuring adapter as accessory for connecting the E-Clip 2 generator current clamp

Connection



- ➭ No probes or auxiliary earth electrodes are required.
- ➭ The earth electrode is not disconnected.
- ➭ Attach the PRO-RE/2 adapter (Z502T) to the test plug.
- ➭ Connect the E-Clip 2 generator clamp (current clamp transformer) via the 4 mm safety plugs at the PRO-RE/2 adapter.
- ➭ Connect the Z3512A current clamp sensor to jacks 15 and 16 at the test instrument.
- ➭ Attach the 2 clamps to an earth electrode (earth spike) at different heights with a clearance of at least 30 cm.

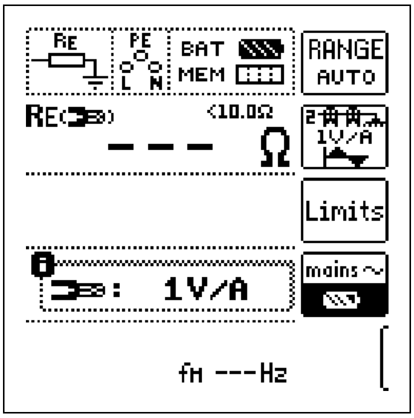
1:100 10 mV / A	100 A / × 100	**100 A**

Important Instructions for Use of the Current Clamp Sensor

- Use only the Z3512A current clamp sensor for this measurement.
- Use the clamp in the permanently connected state. The sensor may not be moved during measurement.
- The current clamp sensor may only be used at an adequate distance from powerful extraneous fields.
- Make sure that the connector cables from the two clamps are laid separate from each other to the greatest possible extent.

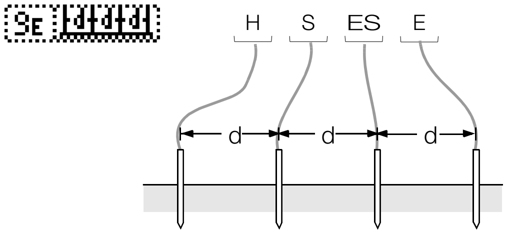
Start Measurement

ON START



15.11 Earthing Resistance Measurement, Battery Powered, “Battery Mode” – Measurement of Soil Resistivity ρ_E (PROFITEST MPRO & PROFITEST MXTRA only)

General



Measurement of Soil Resistivity

The determination of soil resistivity is necessary for the planning of earthing systems. Reliable values need to be ascertained which take even the worst possible conditions into account (see „Geologic Evaluation“ on page 72).

Soil resistivity is decisive with regard to the magnitude of an earth electrode’s dissipation resistance. Soil resistivity can be measured with the test instrument using the method according to Wenner.
Four earth spikes of greatest possible length are driven into the ground in a straight line at distance d from one another, and are connected to the earth tester (see figure above).
The earth spikes usually have a length of 30 to 50 cm. Longer earth spikes can be used for soil which demonstrates poor conductivity (sandy soil etc.). The depth to which the earth spikes are driven into the ground may not exceed one twentieth of distance d.

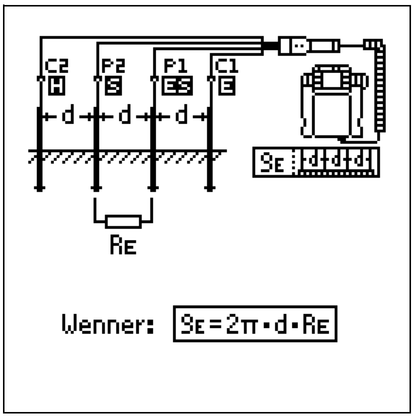
☞ **Note**

Erroneous measurement may result if piping, cables or other underground metal conduits run parallel to the measuring setup.

Soil resistivity is calculated as follows:
$\rho_E = 2\pi \cdot d \cdot R$
Where:
π = 3.1416
d = distance in m between two earth spikes
R = ascertained resistance value in Ω (this value corresponds to R_E as determined with the 4-wire method)

Connection

HELP



Wenner: $\varrho_E = 2\pi \cdot d \cdot R_E$

- ➪ Position the spikes for the probe and the auxiliary electrode at equal distances (see figure above).
- ➪ Make sure that no excessively high contact resistances occur between the probe and the ground.
- ➪ Attach the PRO-RE adapter (Z501S) to the test plug.
- ➪ Connect the probes, the auxiliary electrode and the electrode via the 4 mm banana plug sockets at the PRO-RE adapter. In doing so, observe labeling on the banana plug sockets.

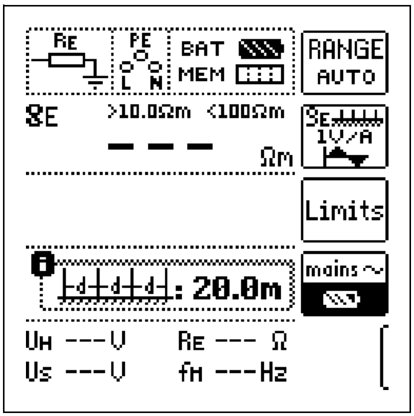
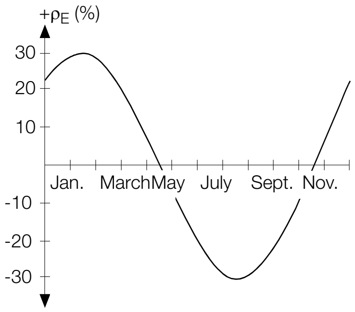
ON START



ϱE >10.0Ωm <100Ωm
– – – Ωm
⊢d┼d┼d┤: 20.0m
UH ---V RE --- Ω
Us ---V fH ---Hz

Geologic Evaluation

Except in extreme cases, the ground is measured down to a depth which is roughly equal to probe distance d.
And thus it’s possible to arrive at conclusions regarding the ground’s stratification by varying probe distance. Layers which are highly conductive (water table) into which earth electrodes should be installed, can thus be discovered within a region which is otherwise not very conductive.
Soil resistivity is subject to considerable fluctuation which may be due to various causes such as porosity, moisture penetration, concentration of dissolved salts in the ground water and climatic fluctuation.
Characteristic values for ρ_E relative to season (soil temperature and the soil’s negative temperature coefficient) can be approximated quite closely by means of a sinusoidal curve.



Soil Resistivity ρE Relative to Season Without the Effects of Precipitation (earth electrode depth < 1.5 m)

A number of typical soil resistivity values for various types of ground are summarized in the following table.

Type of Soil	**Soil Resistivity** ρ_E **[Ωm]**
Marshy ground	8 … 60
Arable soil, loamy and clayey soil, moist gravel	20 … 300
Moist sandy soil	200 … 600
Dry sandy soil, dry gravel	200 … 2000
Rocky ground	300 … 8000
Rock	10^4 … 10^{10}

Calculating Dissipation Resistance

Formulas for calculating dissipation resistance for common types of earth electrodes are included in this table.
These rules of thumb are entirely adequate for actual practice.

Number	**Earth Electrode**	**Rule of Thumb**	**Subsidiary Variable**
1	Earth strip (star type earth electrode)	$R_A = \frac{2 \cdot \rho_E}{I}$	—
2	Earth rod (buried earth electrode)	$R_A = \frac{\rho_E}{I}$	—
3	Ring earth electrode	$R_A = \frac{2 \cdot \rho_E}{3D}$	$D = 1{,}13 \cdot \sqrt[2]{F}$
4	Mesh earth electrode	$R_A = \frac{2 \cdot \rho_E}{2D}$	$D = 1{,}13 \cdot \sqrt[2]{F}$
5	Ground plate	$R_A = \frac{2 \cdot \rho_E}{4{,}5 \cdot a}$	—
6	Hemispherical earth electrode	$R_A = \frac{\rho_E}{\pi \cdot D}$	$D = 1{,}57 \cdot \sqrt[3]{J}$

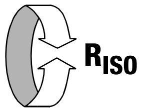
R_A = dissipation resistance (Ω)
ρ_E = soil resistivity (Ωm)
I = length of the earth electrode (m)
D = diameter of a ring earth electrode, diameter of the equivalent surface area of a mesh earth electrode or diameter of a hemispherical earth electrode (m)
F = surface area (sq. meters) of the enclosed surface or a ring or mesh earth electrode
a = Edge length (m) of a square ground plate; a is replaced with the following for rectangular plates: $\sqrt{b \text{ x } c}$, where b and c are the two sides of the rectangle.
J = volume (cubic meters) of an individual foundation footing

Attention!

Insulation resistance may only be measured at voltage-free devices.

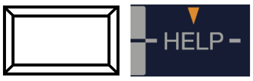
16.1 General

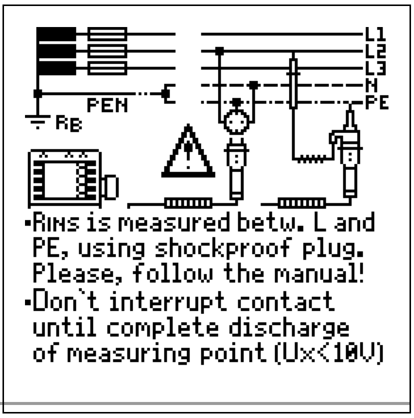
Select Measuring Function



Connection

2 pole adapter or test plug





•RINS is measured betw. L and PE, using shockproof plug. Please, follow the manual!
•Don't interrupt contact until complete discharge of measuring point (Ux<10V)

Note

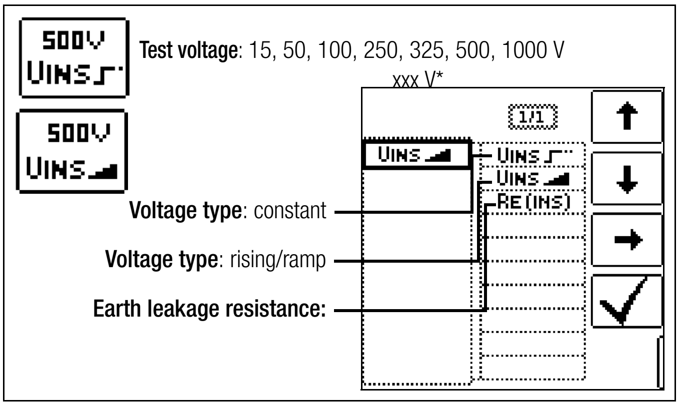
The test instrument always measures insulation between the L and PE terminals.
N and PE must be interrupted for systems without RCD.

Note

Checking Measurement Cables Before Measurements

Before performing insulation measurement, the test probes on the measurement cables should be short-circuited in order to assure that the instrument displays a value of less than 1 kΩ. In this way, incorrect connection can be avoided and interrupted measurement cables can be detected.

Set Parameters



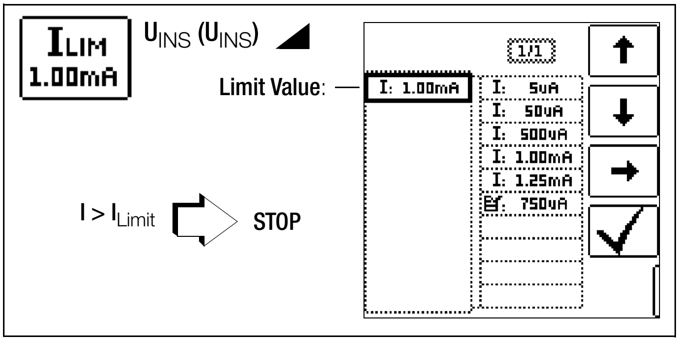
* Freely adjustable voltage (see section 10.8)

Polarity Selection

2-pole measurement (selection relevant for report generation only): **measurements between**
Lx-PE / N-PE / L+N-PE / Lx-N / Lx-Ly / AUTO*
where x, y = 1, 2, 3

* AUTO parameter (see section 10.9)

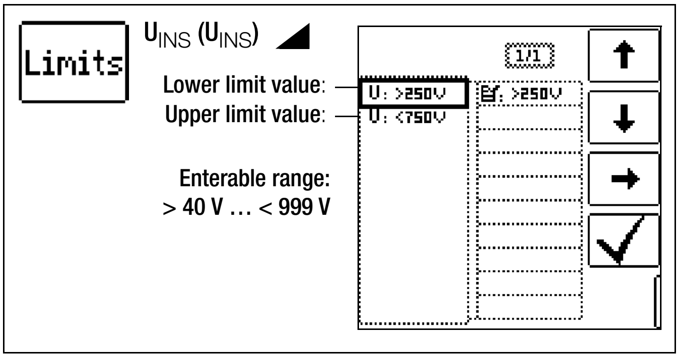
Breakdown Current for Ramp Function



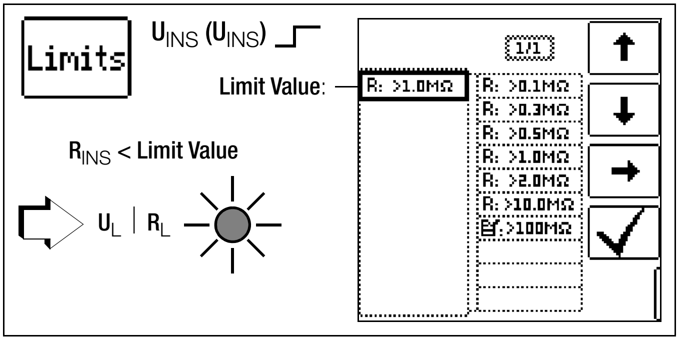
Note

In order to suppress the influence of parallel capacitances on the device under test when measurement is started, shutdown at the respective breakdown current I_{lim} does not occur until a minimum voltage of 5 V is exceeded.

Limit Values for Breakdown Voltage



Limit Values for Constant Test Voltage



❑ **Test Voltage**

A test voltage which deviates from nominal voltage, and is usually lower, can be selected for measurements at sensitive components, as well as systems with voltage limiting devices.

❑ **Voltage Type**

The "U_{INS}◢" **rising test voltage** function **(ramp function)** is used to detect weak points in the insulation, as well as to determine response voltage for voltage limiting components. After pressing the **ON/START ▼** key, test voltage is continuously increased until the specified nominal voltage U_N is reached. **U** is the voltage which is measured at the test probes during and after testing. After measurement, this voltage drops to a value of less than 10 V (see section entitled "Discharging the Device Under Test").

Insulation measurement with rising test voltage is ended:

- As soon as specified maximum test voltage U_N is reached and the measured value is stable

or

- As soon as specified maximum test voltage is reached (e.g. after sparkover occurs at breakdown voltage).

Specified maximum test voltage U_N or any triggering or breakdown voltage which occurs is displayed for **U_{INS}**.

The constant test voltage function offers two options:

- After **briefly** pressing the **ON/START ▼** key, specified test voltage U_N is read out and insulation resistance R_{INS} is measured. As soon as the measured value is stable (settling time may be several seconds in the case of high cable capacitance values), measurement is ended and the last measured values for R_{INS} and U_{INS} are displayed. **U** is the voltage which is measured at the test probes during and after testing. After measurement, this voltage drops to a value of less than 10 V (see section entitled “Discharging the Device Under Test”).

or

- **As long as you** press and hold the **ON/START ▼** key, test voltage U_N is applied and insulation resistance R_{INS} is measured. Do not release the key until the measured value has settled in (settling time may be several seconds in the case of high cable capacitance values). Voltage U, which is measured during testing, corresponds to voltage U_{INS}. After releasing the **ON/START ▼** key, measurement is ended and the last measured values for R_{INS} and U_{INS} are displayed. U drops to a value of less than 10 V after measurement (see the section entitled “Discharging the Device Under Test”.

❑ Pole Selection Report Entry

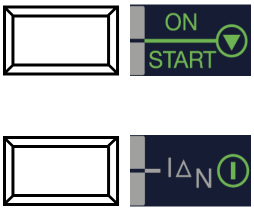
The poles between which testing takes place can only be entered here for reporting purposes. The entry itself has no influence on the actual polarity of the test probes or the pole selection.

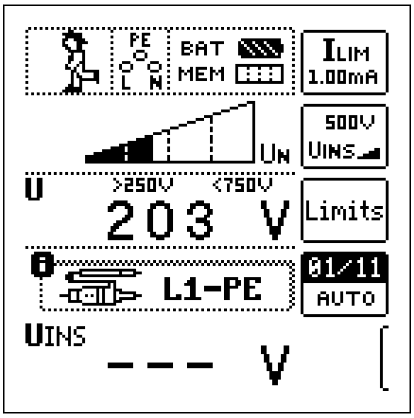
❑ Limits – Setting the Limit Value

The limit value for insulation resistance can be set as desired. If measurement values occur which are below this limit value, the red U_L/R_L LED lights up. A selection of limit values ranging from 0.5 MΩ to 10 MΩ is available. The limit value is displayed above the measured value.

Start Measurement – Rising Test Voltage (ramp function)

Press briefly:





Quick polarity reversal if parameter is set to AUTO: 01/10 … 10/10: L1-PE … L1-L3

> **Note**
> If **semiautomatic polarity reversal** is selected (see section 10.9), the corresponding icon is displayed instead of the ramp.

General Notes Regarding Insulation Measurements with Ramp Function

Insulation measurement with ramp function serves the following purposes:

- Detect weak points in the test object’s insulation
- Determine tripping voltage of voltage limiting components and test them for correct functioning These components may include, for example, varistors, overvoltage limiters (e.g. DEHNguard® from Dehn+Söhne) and spark gaps.

The test instrument uses continuously rising test voltage for this measuring function, up to the maximum selected voltage limit. The measuring procedure is started by pressing the **ON/START ▼** key and runs automatically until one of the following events occurs:

- The selected voltage limit is reached
- The selected current limit is reached

or

- Sparkover occurs (spark gaps)

Differentiation is made amongst the following three procedures for insulation measurement with ramp function:

Testing overvoltage limiters or varistors and determining their tripping voltage:

- Select maximum voltage such that the anticipated breakdown voltage of the device under test is roughly one third of this value (observe manufacturer’s data sheet if applicable).
- Select the current limit value in accordance with actual requirements or the manufacturer’s data sheet (characteristic curve of the device under test).

Determining tripping voltage for spark gaps:

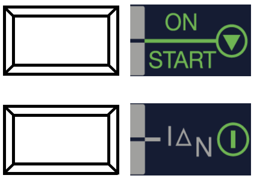
- Select maximum voltage such that the anticipated breakdown voltage of the device under test is roughly one third of this value (observe manufacturer’s data sheet if applicable).
- Select the current limit value in accordance with actual requirements within a range of 5 to 10 µA (response characteristics are too unstable with larger current limit values, which may result in faulty measurement results).

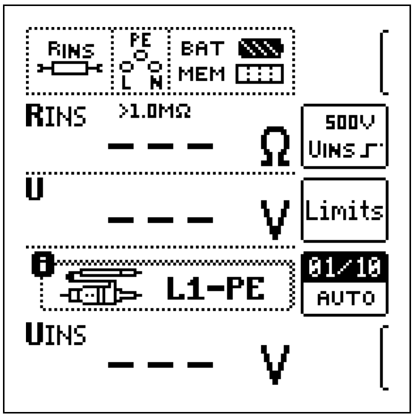
Detecting weak points in the insulation:

- Select maximum voltage such that it does not exceed the test object’s permissible insulation voltage; it can be assumed that an insulation fault will occur even with a significantly lower voltage if an accordingly lower maximum voltage value is selected (nevertheless at least greater than anticipated breakdown voltage) – the ramp is less steep as a result (increased measuring accuracy).
- Select the current limit value in accordance with actual requirements within a range of 5 to 10 µA (see also settings for spark gaps).

Start Measurement – Constant Test Voltage

Press and hold for long-term measurement:





Quick polarity reversal if parameter is set to AUTO: 01/10 … 10/10: L1-PE … L1-L3

> **Note**
> The instrument’s batteries are rapidly depleted during the insulation resistance measurement. When using the **constant test voltage** function, only press and hold the start key ▼ until the display has become stable (if long-term measurement is required).

Special Condition for Insulation Resistance Measurement

Attention!

Insulation resistance can only be measured at voltage-free objects.

If measured insulation resistance is less than the selected limit value, the **UL/RL** LED lights up.

If an interference voltage of ≥ 25 V is present within the system, insulation resistance is not measured. The **MAINS/NETZ** LED lights up and the **interference voltage** pop-up message appears.

All conductors (L1, L2, L3 and N) must be tested against PE!

Attention!

Do not touch the instrument’s terminal contacts during insulation resistance measurements!

If nothing has been connected to the terminal contacts, or if a resistive load component has been connected for measurement, your body would be exposed to a current of approximately 1 mA at a voltage of 1000 V. The resultant perceptible shock may lead to injury (e.g. resulting from a startled reaction etc.).

Discharging the Device Under Test

Attention!

If measurement is performed at a capacitive object such as a long cable, it becomes charged with up to approx. 1000 V! **Touching such objects is life endangering!**

When an insulation resistance measurement has been performed on a capacitive object it’s automatically discharged by the instrument after measurement has been completed. Contact with the device under test must be maintained to this end. The falling voltage value can be observed at the U display.

Attention!

Do not disconnect the DUT until less than 10 V is displayed for U!

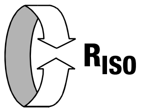
Evaluating Measured Values

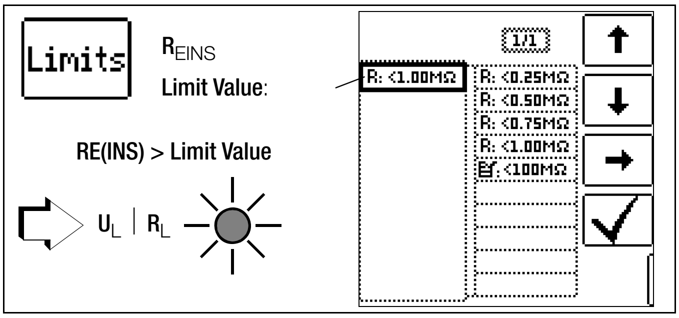
Instrument measuring error must be taken into consideration in order to assure that the limit values set forth in DIN VDE regulations are not fallen short of. The required minimum display values for insulation resistance can be determined with the help of Table 3 on page 102. These values take maximum device error into consideration (under nominal conditions of use). Intermediate values can be interpolated.

16.2 Special Case: Earth Leakage Resistance (R_{EISO})

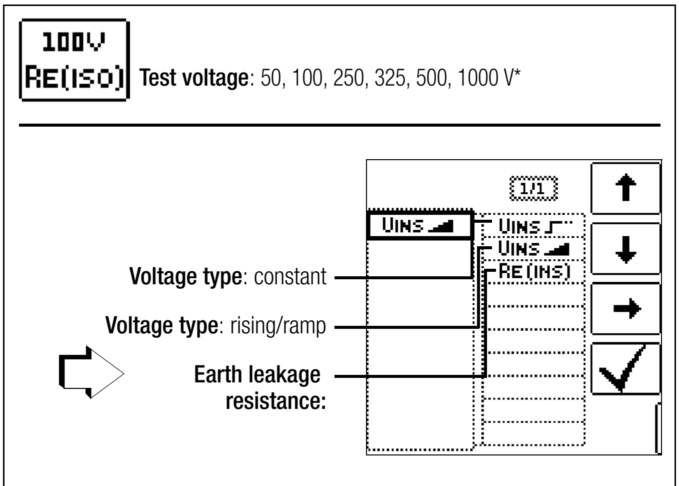
This measurement is performed in order to determine electrostatic discharge capacity for floor coverings in accordance with EN 1081.

Select Measuring Function



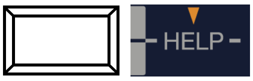


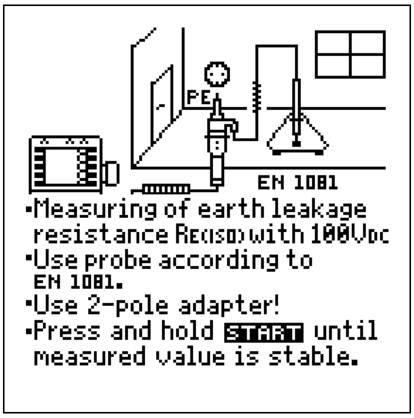
Set Parameters



* Freely adjustable voltage (see section 10.8)

Connection and Test Setup

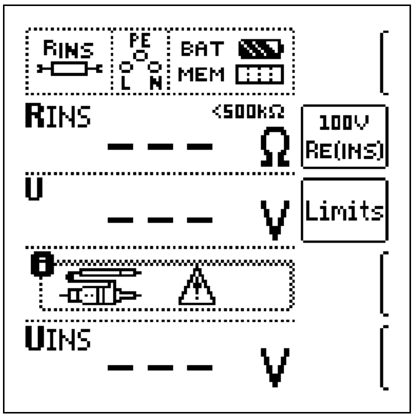




- Measuring of earth leakage resistance RE(ISO) with 100VDC
- Use probe according to EN 1081.
- Use 2-pole adapter!
- Press and hold START until measured value is stable.

- ➩ Rub the floor covering at the point at which measurement is to be performed with a dry cloth.
- ➩ Place the 1081 floor probe onto the point of measurement and load it with a weight of at least 300 N (30 kg).
- ➩ Establish a conductive connection between the measuring electrode and the test probe and connect the measuring adapter (2-pole) to an earth contact, e.g. the earthing contact at a mains outlet or a central heating radiator (prerequisite: reliable ground connection).

Start Measurement



The limit value for earth leakage resistance from the relevant regulations applies.

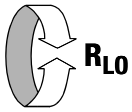
17 Measuring Low-Value Resistance of up to 200 Ω (Protective Conductor and Equipotential Bonding Conductor)

According to the regulations, the measurement of low-value resistance at protective conductors, earth conductors or bonding conductors must be performed with (automatic) polarity reversal of the test voltage, or with current flow in one (+ pole to PE) and then the other direction (– pole to PE).

⚠ **Attention!**

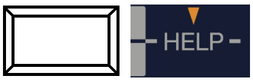
Low-resistance may only be measured at voltage-free objects.

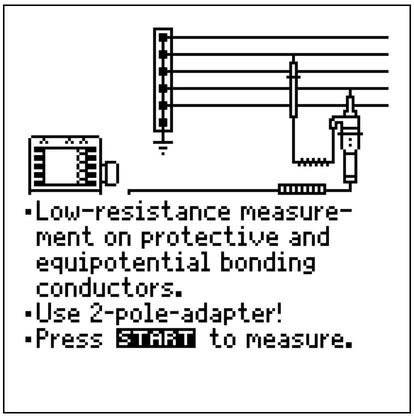
Select Measuring Function



Connection

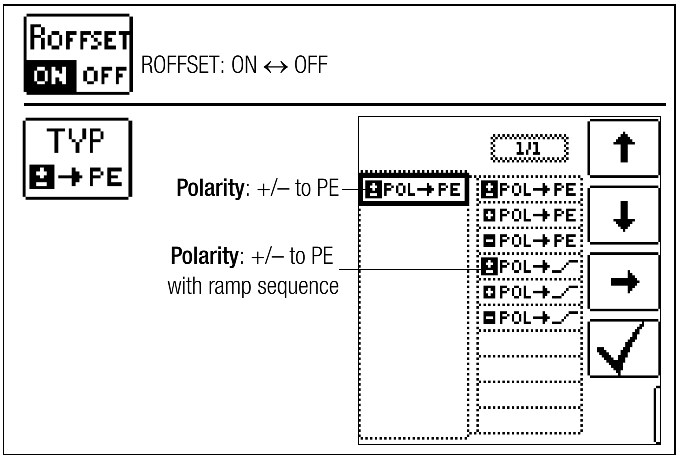
via 2-pole adapter only!





•Low-resistance measurement on protective and equipotential bonding conductors.
•Use 2-pole-adapter!
•Press START to measure.

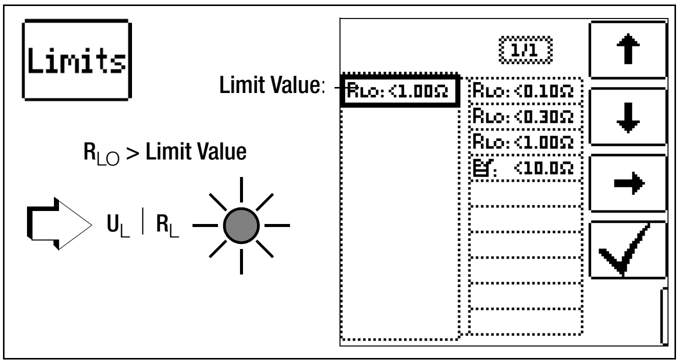
Set Parameters



ROFFSET: ON ↔ OFF

Polarity: +/– to PE

Polarity: +/– to PE with ramp sequence



Limit Value:

R_{LO} > **Limit Value**

U_L | R_L

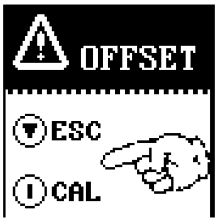
❏ **ROFFSET ON/OFF**
– Compensation for Measurement Cables up to 10 Ω

If measurement cables or extension cables are used, their resistance can be automatically subtracted from the measurement results. Proceed as follows:

- ➪ Switch **ROFFSET** from OFF to ON. **Roffset = 0.00** Ω appears in the footer.
- ➪ Select a polarity option or automatic polarity reversal.
- ➪ Short-circuit the end of the measurement extension cable with the second test probe at the instrument.
- ➪ Start measurement of offset resistance with $I_{\Delta N}$.

First of all, an intermittent acoustic warning is generated and a blinking message appears, in order to prevent inadvertent deletion of a previously saved offset value.

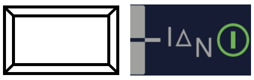
- ➪ Start offset measurement by pressing the triggering key once again or abort offset measurement by pressing the **ON/START** ▼ key (in this case = **ESC**).

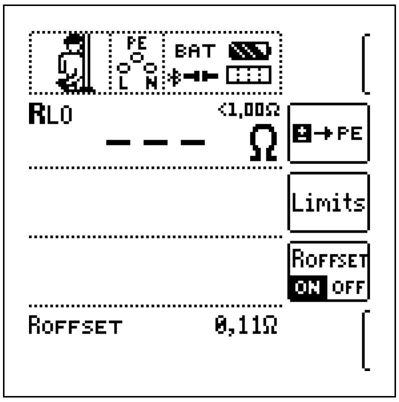


☞ **Note**

If offset measurement is stopped upon appearance of a pop-up error window indicating **Roffset > 10 Ω or a difference between RLO+ and RLO– of greater than 10%**, the last measured offset value is retained. Inadvertent deletion of a previously ascertained offset value is thus practically ruled out. The respectively smaller value is otherwise stored to memory as an offset value. The maximum offset value is 10.0 Ω. Negative resistances may result due to the offset value.

Measuring ROFFSET





The **ROFFSET x.xx** Ω message now appears in the footer at the display, where x.xx can be a value between 0.00 and 10.0Ω. This value is subtracted from the actual measuring results for all subsequent R_{LO} measurements, if the **ROFFSET ON/OFF** key has been set to **ON**.

ROFFSET must be redetermined in the following cases:

- After switching to a different polarity option
- After switching from **ON** to **OFF** and back again

The offset value can be deliberately deleted by switching **ROFFSET** from **OFF** to **ON**.

☞ **Note**

Only use this function when performing measurements with extension cables.
When different extension cables are used, the above described procedure must always be repeated.

❏ **Type / Polarity**

The direction in which current flows can be selected here.

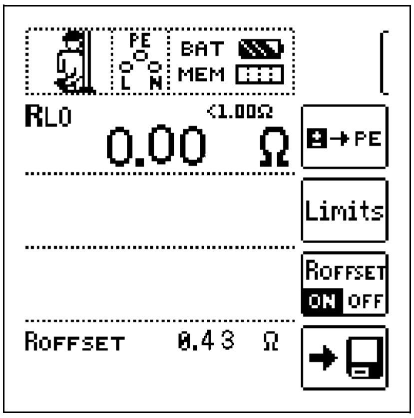
❏ **Limits – Setting the Limit Value**

The limit value for resistance can be set as desired. If measured values occur which are above this limit value, the red **UL/RL** LED lights up. Limit values can be selected within a range of 0.10 Ω to 10.0 Ω (editable). The limit value is displayed above the measured value.

17.1 Measurement with Constant Test Current

Start Measurement

Press and hold for long-term measurement



Attention!

The test probes should always be in contact with the device under test before the Start key ▼ is activated.
If the DUT is energized, measurement is disable as soon as it's contacted with the test probes.
If the start key ▼ is pressed first and the DUT is contacted with the test probes afterwards, the fuse blows.
Which of the two fuses has blown is indicated in the pop-up window with the error message by means of an arrow.

In the case of single-pole measurement, the respective value is saved to the database as R_{LO}.

Polarity Selection	Display	Condition
+ pole to PE	**RLO+**	None
– pole to PE	**RLO–**	None
± Pole to PE	**RLO**	Where Δ**RLO** ≤ 10%
	RLO+ **RLO–**	Where Δ**RLO** > 10%

Automatic Polarity Reversal

After the measuring sequence has been started, the instrument performs the measurement with automatic polarity reversal, first with current flow in one direction, and then in the other. In the case of long-term measurement (press and hold **ON/START** ▼ key), polarity is switched once per second.

If the difference between RLO+ and RLO– is greater than 10% with automatic polarity reversal, RLO+ and RLO– values are displayed instead of RLO. The respectively larger value, RLO+ or RLO–, appears at the top and is saved to the database as the RLO value.

Evaluating Measurement Results

Differing results for measurements in both directions indicate voltage at the DUT (e.g. thermovoltages or unit voltages).

Measurement results can be distorted by parallel connected impedances in load current circuits and by equalizing current, especially in systems which make use of overcurrent protection devices (previous neutralization) without an isolated protective conductor. Resistances which change during measurement (e.g. inductance), or a defective contact, can also cause distorted measurements (double display).

In order to assure unambiguous measurement results, causes of error must be located and eliminated.

In order to find the cause of the measuring error, measure resistance in both current flow directions.

The instrument's batteries are exposed to excessive stress during insulation resistance measurement. For measurement with current flow in one direction, only press and hold the **ON/START** ▼ key as long as necessary for the measurement.

Note

Measuring Low-Value Resistance
Measurement cable and 2-pole measuring adapter resistance is compensated automatically thanks to the 4-wire method and thus doesn't effect measurement results. However, if an extension cord is used its resistance must be measured and deducted from the measurement results.

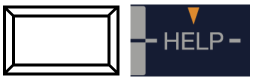
Resistances which do not demonstrate a stable value until after a "settling in period" should not be measured with automatic polarity reversal, but rather one after the other with positive and negative polarity.
Examples of resistances whose values may change during measurement include:
- Incandescent lamp resistance, whose values change due to warming caused by test current
- Resistances with a large conductive component
- Contact resistance

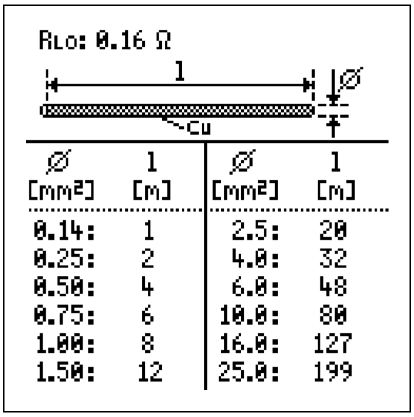
Evaluating Measured Values

See Table 4 on page 102.

Calculation of Cable Lengths for Common Copper Conductors

If the **HELP** key is activated after performance of resistance measurement, the cable lengths corresponding to common conductor cross sections are displayed.





RLO: 0.16 Ω

Ø [mm²]	l [m]	Ø [mm²]	l [m]
0.14:	1	2.5:	20
0.25:	2	4.0:	32
0.50:	4	6.0:	48
0.75:	6	10.0:	80
1.00:	8	16.0:	127
1.50:	12	25.0:	199

If results vary for the two different current flow directions, cable length is not displayed. In this case, capacitive or inductive components are apparently present which would distort the calculation.

This table only applies to cables made with commercially available copper conductors and cannot be used for other materials (e.g. aluminum).

17.2 Protective Conductor Resistance Measurement with Ramp Sequence – Measurement at PRCDs with Current-Monitored Protective Conductor using the PROFITEST PRCD Test Adapter as an Accessory (PROFITEST MXTRA only)

Application

Protective conductor current is monitored for certain types of PRCDs. Direct activation or deactivation of the test current required for protective conductor resistance measurements of at least 200 mA results in tripping of the PRCD and thus to interruption of the protective conductor connection. Protective conductor measurement is no longer possible in this case.

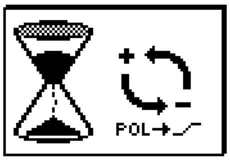
A special ramp sequence for test current activation and deactivation in combination with the PROFITEST PRCD test adapter permits protective conductor resistance measurement without tripping the PRCD.

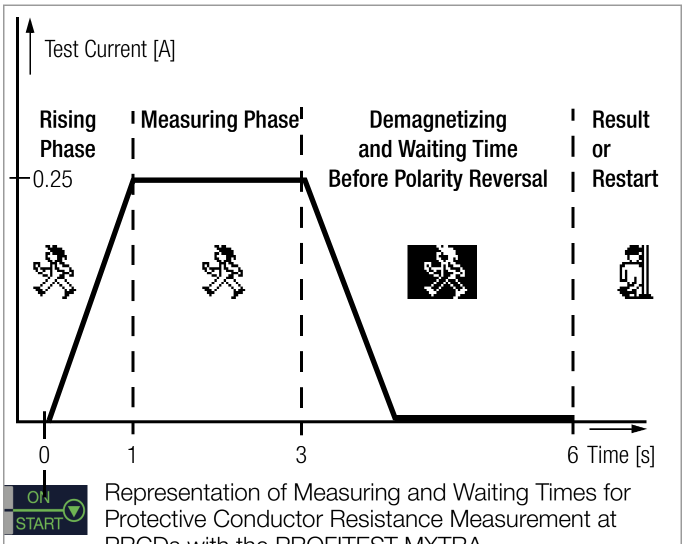
Ramp Function Time Sequence

Due to the physical characteristics of the PRCD, measuring times for this ramp function amount to several seconds.

If test current polarity is revered, additional waiting time is also required during polarity reversal.
This is programmed into the test sequence in the “automatic polarity reversal” ±POL→_/‾ operating mode.

Reverse polarity manually, e.g. from “+pole with ramp” +POL→_/‾ to “-pole with ramp” −POL→_/‾. The test instrument then detects the reversal of current flow direction, stops measurement for the required waiting time and simultaneously displays a corresponding message (see figure at right).



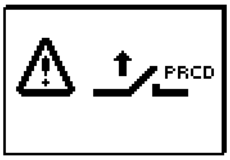


Representation of Measuring and Waiting Times for Protective Conductor Resistance Measurement at PRCDs with the PROFITEST MXTRA

PRCD Tripping due to Poor Contacting

Good contact must be assured between the test probes at the 2-pole adapter and the device under test or the sockets at the PROFITEST PRCD test adapter during measurement. Interruptions can result in considerable test current fluctuation which causes the PRCD to trip under unfavorable conditions.

If this is the case, tripping of the PRCD is automatically detected by the test instrument and indicated by a corresponding error message (see figure at the right). In this case as well, the test instrument automatically takes subsequently required waiting time into account before you can reactivate the PRCD and start the measurement over again.



Connection

- ➪ Read the operating instructions for the PROFITEST PRCD adapter, in particular section 4.1. It includes connection instructions for offset measurement and for protective conductor resistance measurement.

Selecting the Polarity Parameter

- ➪ Select the desired polarity parameter with ramp.

±POL→_/‾
+POL→_/‾
−POL→_/‾

Measuring ROFFSET

- ➪ Perform offset measurement as described on page 78, in order to assure that the test adapter’s connector contacts are not included in the measurement results.

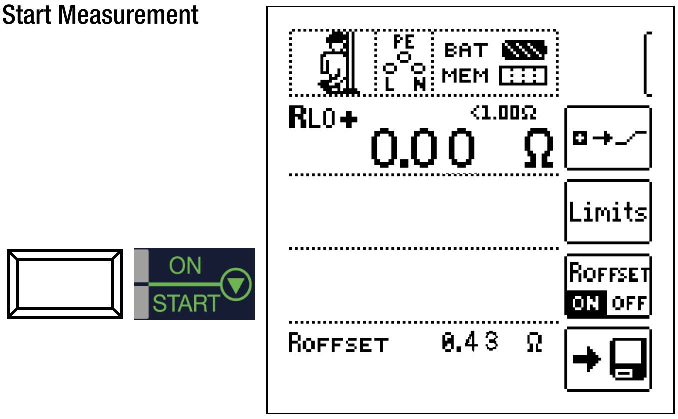
☞ **Note**

The offset is only retained in memory until the polarity parameter is changed. If measurement is performed with manual polarity reversal (+pole or -pole), the offset measurement has to be repeated in both polarities before each measurement.

Measuring Protective Conductor Resistance

- ➪ Determine whether or not the PRCD is activated. If not, activate it.
- ➪ Perform protective conductor measurement as described in section 17.1 above. Start the test sequence by briefly pressing the **ON/START** ▼ key. The predetermined duration of the measuring phase can be extended by pressing and holding the **ON/START** ▼ key.

Start Measurement



The symbol shown at the right appears during the magnetization phase (rising curve) and the subsequent measuring phase (constant current).

If measurement is aborted already during the rising phase, no measurement results can be ascertained or displayed.

After measurement, the demagnetization phase (falling curve) and subsequent waiting time are indicated by the inverted symbol shown at the right.
No new measurements can be started during this time.

Measurement results cannot be read and measurement with the same or another polarity cannot be started until the symbol at the right appears.

18 Measurement with Accessory Sensors

18.1 Current Measurement with Current Clamp Sensor

Bias, leakage and circulating current up to 1 A, as well as leakage current up to 1000 A can be measured with the help of special current clamp sensors, which are connected to sockets 15 and 16.

⚠ **Attention!**

Danger: High-Voltage!

Use only current clamp sensors which are specifically offered as accessories by Gossen Metrawatt GmbH. Other current clamp sensors might not be terminated with an output load at the secondary side. Dangerously high voltage may endanger the user and the device in such cases.

⚠ **Attention!**

Maximum input voltage at the test instrument!

Do not measure any currents which are greater than specified for the measuring range of the respective clamp. Input voltage for clamp connector sockets 15 and 16 at the test instrument may not exceed 1 V!

⚠ **Attention!**

Be sure to read and adhere to the operating instructions for current clamp sensors and the safety precautions included therein, especially those regarding the approved measuring category.

Select Measuring Function

SENSOR

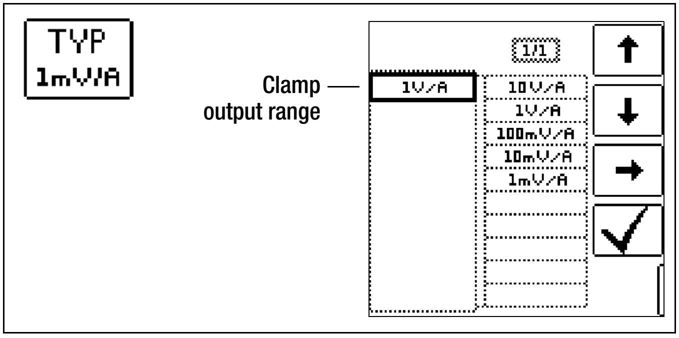
Select Measuring Range at the Current Clamp Sensor

Test Instrument	Clamp Meters				Test Instrument
Transformation Ratio Parameter	WZ12C Switch	Z3512A Switch	WZ12C Measuring Range	Z3512A Measuring Range	Measuring Range
1:1 1 V / A	1 mV / mA	x 1000 [mV/A]	1 mA … **15 A**	0 … **1 A**	5 … 999 mA
01:10 100 mV / A	—	x 100 [mV/A]	—	0 … **10 A**	0.05 … 10 A
1:100 10 mV / A	—	x 10 [mV/A]	—	0 … **100 A**	0.5 … 100 A
1:1000 1 mV / A	1 mV / A	x 1 [mV/A]	1 A … **150 A**	0 … **1000 A**	5 … 150A/999A

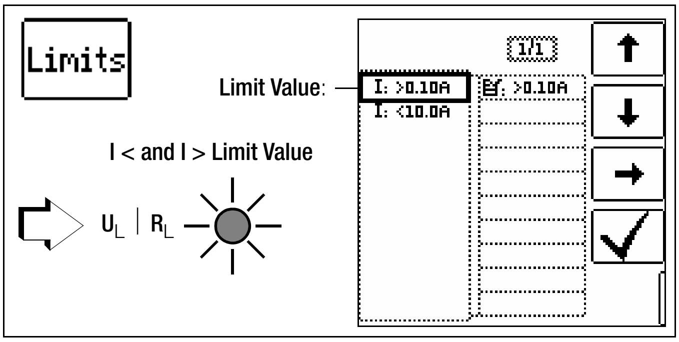
Test Instrument	Clamp		Test Instrument
Transformation Ratio Parameter	METRAFLEX P300 Switch	METRAFLEX P300 Measuring Range	Measuring Range
1:1 1 V / A	3 A (1 V/A)	**3 A**	5 … 999 mA
01:10 100 mV / A	30 A (100 mV/A)	**30 A**	0.05 … 10 A
1:100 10 mV / A	300 A (10 mV/A)	**300 A**	0.5 … 100 A

Set Parameters

The transformation ratio parameter must be correspondingly set at the test instrument depending upon the respectively selected measuring range at the current clamp sensor.



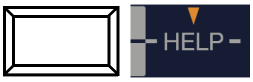
TYP 1mV/A

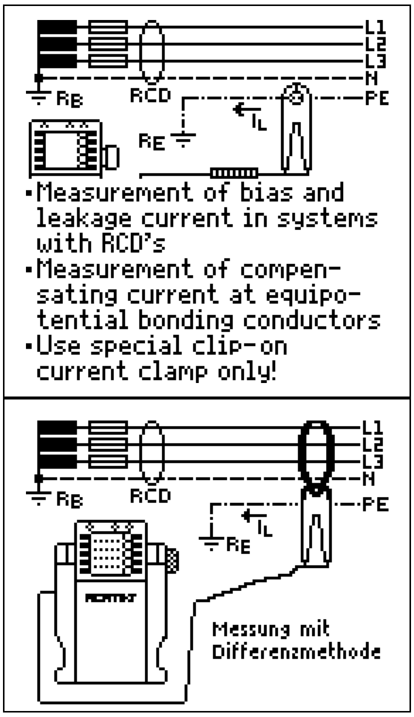


Limits

Specifying limit values results in automatic evaluation at the end of the measurement.

Connection

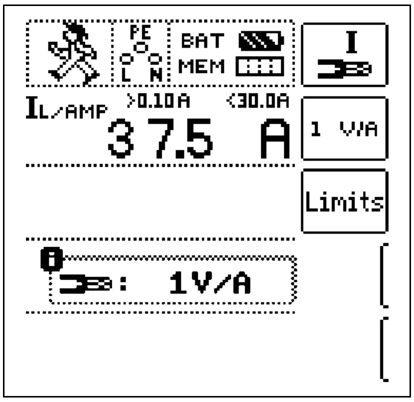




•Measurement of bias and leakage current in systems with RCD's
•Measurement of compensating current at equipotential bonding conductors
•Use special clip-on current clamp only!

Start Measurement

Press the OK key to stop the measurement.



19 Special Functions – EXTRA Switch Position

Select the EXTRA Switch Position

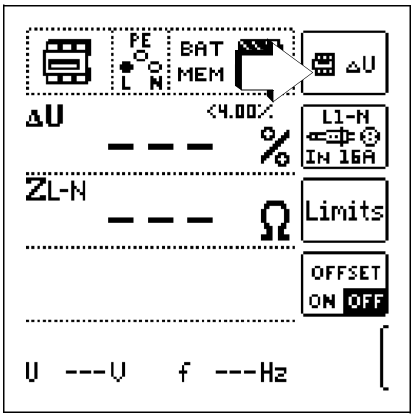
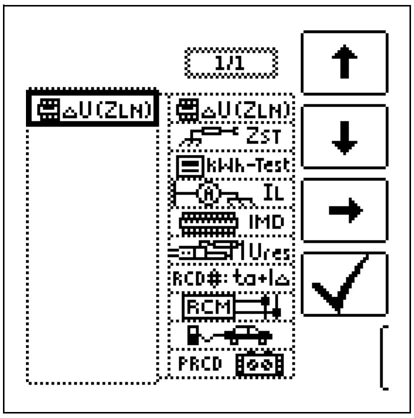
Selecting Special Functions

The list of special functions is accessed by pressing the uppermost softkey. Select the desired function with the appropriate icon.





19.1 Voltage Drop Measurement (at Z_{LN}) – ΔU Function

Significance and Display of ΔU (per IEC 60364-6)

Voltage drop from the intersection of the distribution network and the consumer system to the point of connection of an electrical power consumer (electrical outlet or device connector terminals) should not exceed 4% of nominal line voltage.

Calculating voltage drop (without offset):

$\Delta U = Z_{L\text{-}N} \times$ nominal current of the fuse

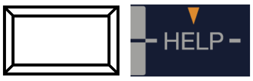
Calculating voltage drop (with offset):

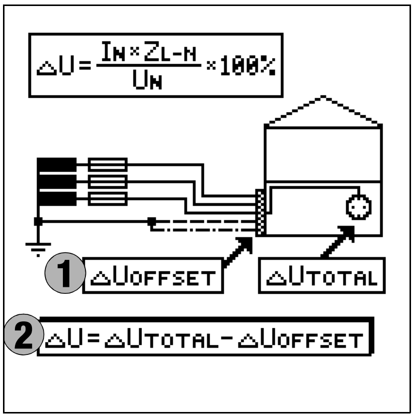
$\Delta U = (Z_{L\text{-}N} - Z_{OFFSET}) \times$ nominal current of the fuse

ΔU in % $= 100 \times \Delta U / U_{L\text{-}N}$

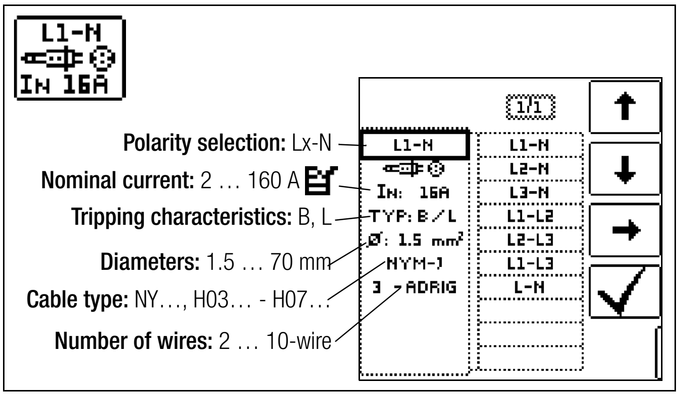
See also section 14 regarding the measurement procedure and connection.

Connection and Test Setup





Set Parameters



Polarity selection: Lx-N

Nominal current: 2 … 160 A

Tripping characteristics: B, L

Diameters: 1.5 … 70 mm

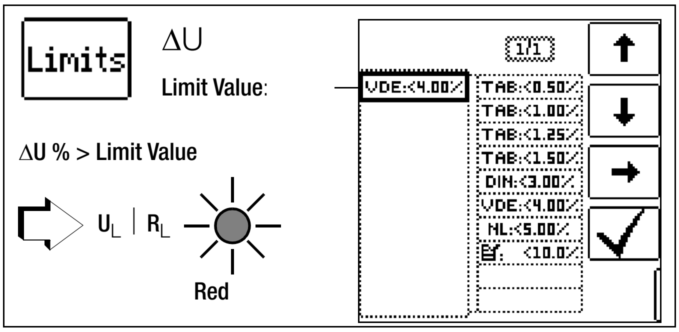
Cable type: NY…, H03… - H07…

Number of wires: 2 … 10-wire

Note

If nominal current I_N is changed by ΔU_{OFFSET}, the offset value is automatically adjusted.

Set Limit Values



ΔU

Limit Value:

ΔU % > Limit Value

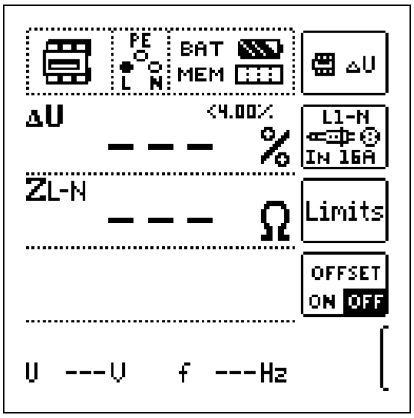
Red

TAB	Limit value per German technical connection conditions for connection to low-voltage mains between the distribution network and the measuring device
DIN	Limit value per DIN 18015-1: ΔU < 3% between the measuring device and the consuming device
VDE	Limit value per DIN VDE 0100-520: ΔU < 4% between the distribution network and the consuming device (adjustable up to 10% in this case)
NL	Limit value per NIV: ΔU < 5%

Measurement Without OFFSET

Proceed as follows:

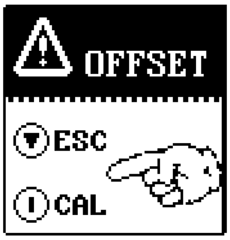
- Switch **OFFSET** from **ON** to **OFF**.



Determine OFFSET (in %).

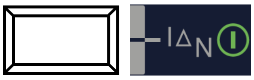
Proceed as follows:

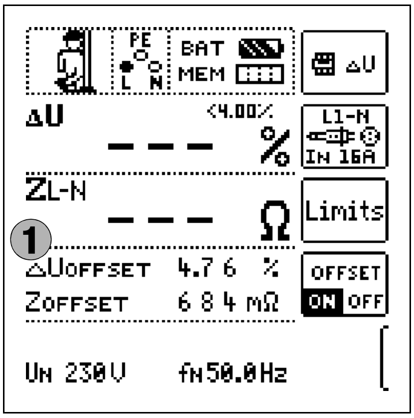
- Switch **OFFSET** from **OFF** to **ON**. **ΔUOFFSET = 0.00%** is displayed.
- Connect the test probe to the point of common coupling (measuring device / meter).
- Start measurement of offset with $I\Delta_N$.



First of all, an intermittent acoustic warning is generated and a blinking message appears, in order to prevent inadvertent deletion of a previously saved offset value.

- Start offset measurement by pressing the triggering key once again, or abort offset measurement by pressing the **ON/START ▼** key (in this case **ESC**).

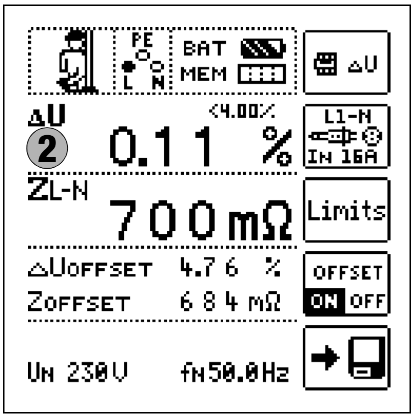




ΔUOFFSET x.xx % is displayed and x.xx can be a value within a range of 0.00 to 99.9%.

An error message appears in a pop-up window if Z exceeds 9.99 Ω.

Start measurement with OFFSET.

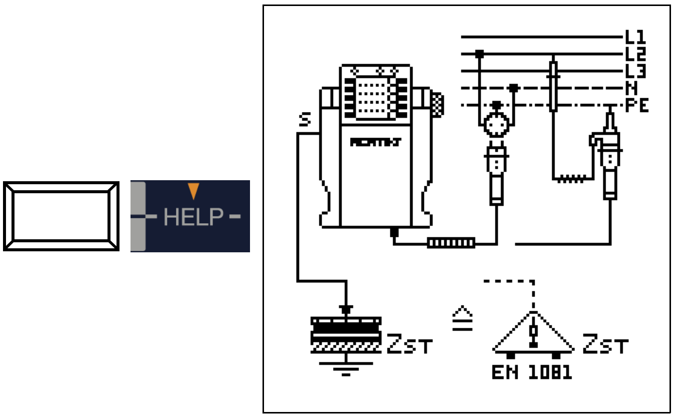


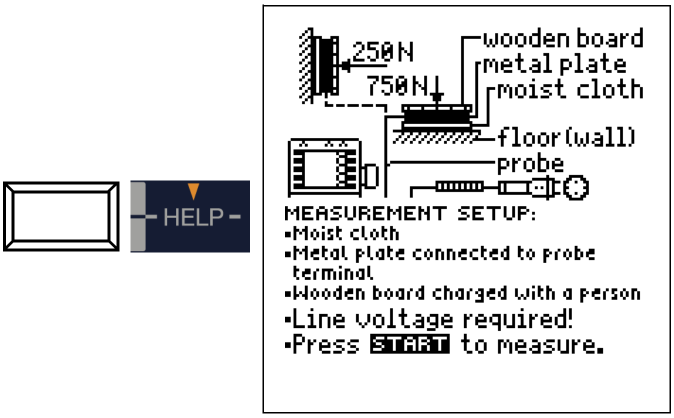
19.2 Measuring the Impedance of Insulating Floors and Walls (standing surface insulation impedance) – Z_{ST} Function

Measuring Method

The instrument measures the impedance between a weighted metal plate and earth. Line voltage available at the measuring site is used as an alternating voltage source. The Z_{ST} equivalent circuit is considered a parallel circuit.

Connection and Test Setup





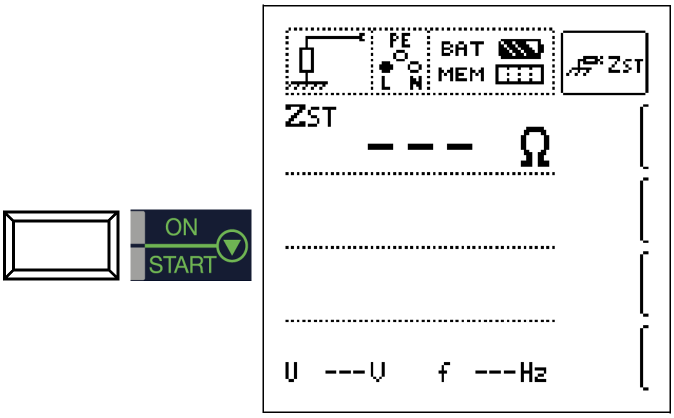
MEASUREMENT SETUP:
- Moist cloth
- Metal plate connected to probe terminal
- Wooden board charged with a person
- Line voltage required!
- Press START to measure.

Note
Use the measuring setup described in section 16.2 (triangular probe) or the one outlined below:

- Cover the floor or the wall at unfavorable locations, e.g. at joints or abutments, with a damp cloth measuring approx. 270 × 270 mm.
- Place the 1081 Probe on top of the damp cloth and load the probe with a weight of 750 N (75 kg, i.e. one person) for floors, or 250 N (25 kg) for walls, e.g. press against the wall with one hand which is insulated with a glove).
- Establish a conductive connection to the 1081 Probe, and connect it to the probe connector socket at the instrument.
- Connect the instrument to a mains outlet with the test plug.

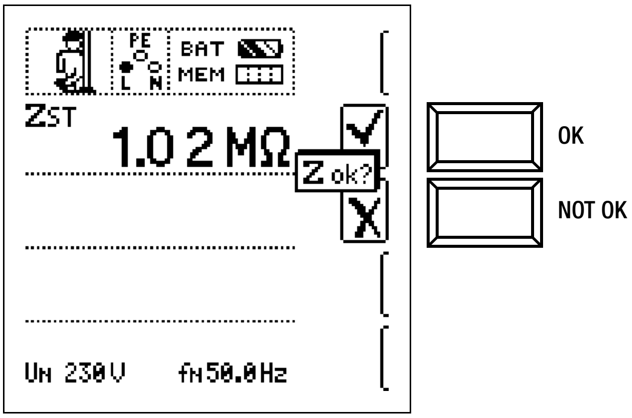
Attention!
Do **not** touch the metal plate or the damp cloth with your bare hands.
No more than 50% line voltage may be applied to these parts! Current with a value of up to 3.5 mA may flow!
The measured value would be distorted as well.

Start Measurement



Evaluate Measured Value

The measured value has to be evaluated after measurement has been completed:



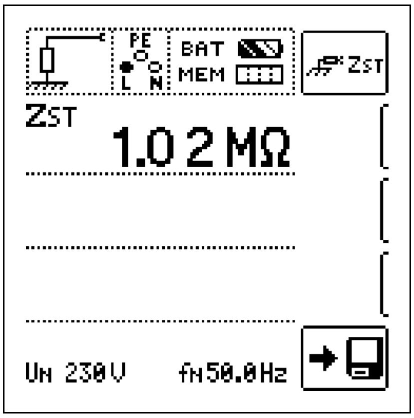
Resistance values must be measured at several points in order to provide for adequate evaluation. Measured resistance may not be less than 50 kΩ at any given point. If the measured value is greater than 30 MΩ, Z_{ST} > 30.0 MΩ always appears at the display panel.

In the event that “NOT OK” is selected, an error is indicated by the **UL/RL** LED which lights up red.

See also Table 5 on page 103 with regard to evaluating measured values.

The measured value cannot be saved to memory and included in the test report until it has been evaluated.

Save measured value

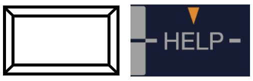


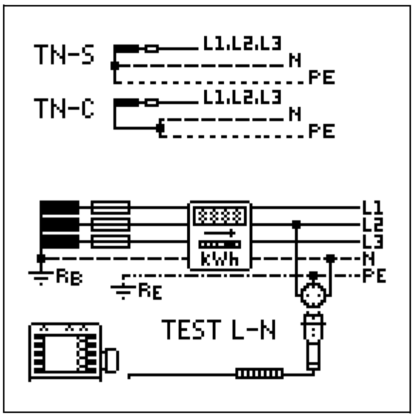
19.3 Testing Meter Startup with Earthing Contact Plug – kWh Function

Energy consumption meters can be tested for correct startup with this function.

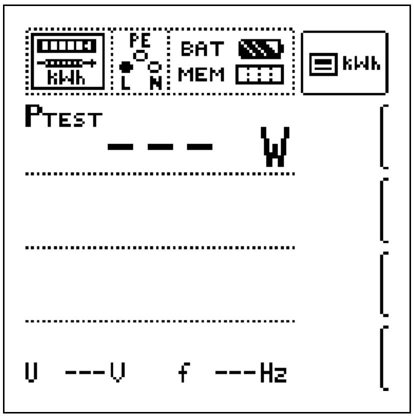
Connection L – N

Earthing Contact Plug





Start Measurement



The meter is tested with the help of an internal load resistor and a test current of approximately 250 mA. After pressing the **Start** key, test power is displayed and the meter can be tested for proper startup within a period of 5 seconds. The “RUN” pictograph is displayed.

TN systems: All 3 phase conductors must be tested against N, one after the other.

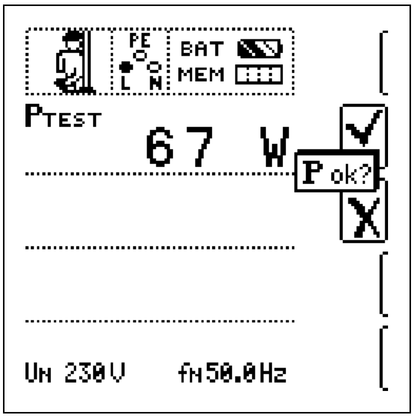
In other types of systems, all phase conductors (active conductors) must be tested against one another.

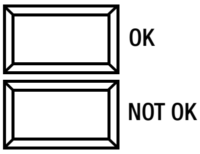
☞ **Note**

If minimum power is not reached, the test is either not started or aborted.

Evaluate Measured Value

The measured value has to be evaluated after measurement has been completed:

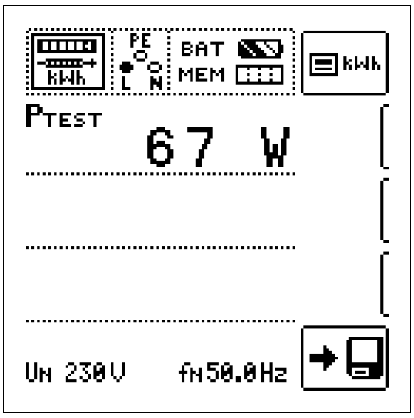




In the event that “NOT OK” is selected, an error is indicated by the **UL/RL LED** which lights up red.

The measured value cannot be saved to memory and included in the test report until it has been evaluated.

Save measured value

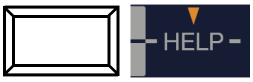


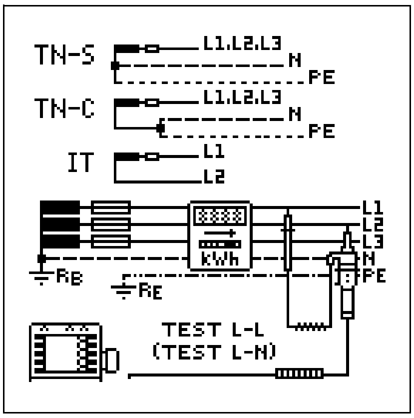
Special Case

Startup of energy consumption meters which are connected between L and L or L and N can be tested with this function.

Connection L – L

2-Pole Adapter





☞ **Note**

If an earthing contact outlet is not available, you can use the 2-pole adapter. N must be contacted with the PE test probe (L2), and then measurement must be started.
If PE is contacted with the PE test probe (L2) during the meter startup test, approximately 250 mA flow through the protective conductor and any upstream RCD is tripped.

19.4 Leakage Current Measurement with PRO-AB Leakage Current Adapter as Accessory – I_L Function (PROFITEST MXTRA only)

Application

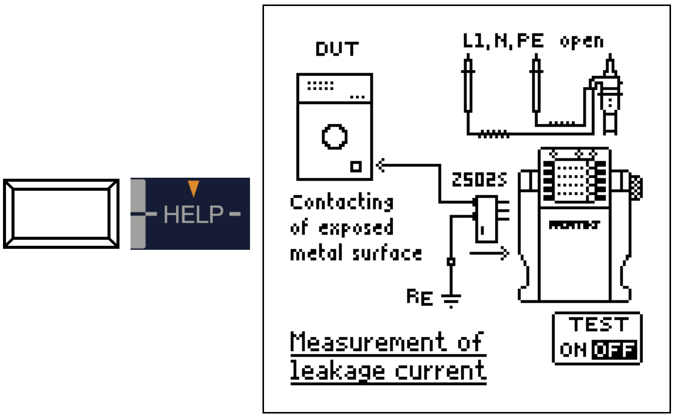
Measurement of touch voltage in accordance with DIN VDE 0107, part 10, as well as continuous leakage and patient auxiliary current per IEC 62353 (VDE 0750-1) / IEC 601-1 / EN 60601-1, is possible using the PRO-AB leakage current measuring adapter as an accessory with the test instrument.

As specified in the standards listed above, current values of up to 10 mA can be measured with this measuring adapter. In order to be able to fully cover this measuring range using the measurement input provided on the test instrument (2-pole current clamp input), the measuring instrument is equipped with range switching including transformation ratios of 10:1 and 1:1. In the 10:1 range, voltage dividing takes place at the same ratio.

Connection and Test Setup

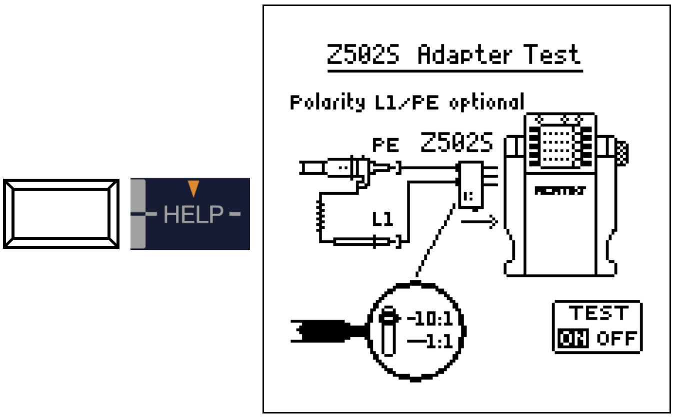
In order to perform the leakage current measurement, the adapter's measurement outputs must be plugged into the measurement inputs at the left-hand side of the test instrument (2-pole current clamp input and probe input).

Either of the leakage current measuring adapter's inputs is connected to reference earth (e.g. safe earth electrode / equipotential bonding) via a measurement cable. The metallic housing (accessible part) of the device under test is contacted with a test probe or alligator clip which is connected to the other input by means of a second measurement cable.



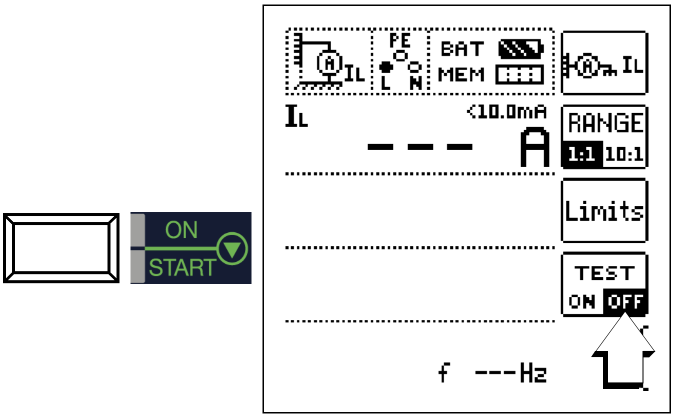
Testing the PRO-AB Adapter

The adapter should be tested before use and at regular intervals (see adapter operating instructions).



Measuring Procedure

Refer to the operating instructions for the PRO-AB leakage current measuring adapter regarding performance of the measurement.



Attention!

The test plug should be located in the storage slot during leakage current measurement. Under no circumstances may the test plug be connected with any system components, including PE / ground potential (measured values might otherwise be distorted).

The measurement can be started or stopped by pressing the **ON/ START ▼** key. Leakage current measurement is a long-term measurement, i.e. is continues until it's stopped by the user. The momentary measured value is displayed continuously during measurement.

Note

The self-test must be deactivated in the menu (set **"TEST ON/OFF" function key to "OFF"**) in order to perform a measurement.

Always start with the large measuring range (10:1), unless there's no doubt that small measured values can be expected, in which case the small measuring range can be used (1:1). The measuring range must be selected at the measuring adapter, as well as in the menu using the corresponding function key (**RANGE**). It must be assured that the range settings at the adapter and at the test instrument are always identical, in order to prevent any distortion of measurement results.

Depending on the magnitude of the measured values, the range setting can or must (in the case of overranging) be manually corrected at the measuring adapter and the test instrument.

Individual limit values can be adjusted after pressing the **Limits** function key. Exceeded limit values are indicated by the red limit value LED at the test instrument.

19.5 Testing Insulation Monitoring Devices – IMD Function (PROFITEST MXTRA only)

Application

Insulation monitoring devices (IMDs) or earth fault detection systems (EDSs) are used in IT systems in order to monitor adherence to a minimum insulation resistance value as specified by DIN VDE 0100-410.

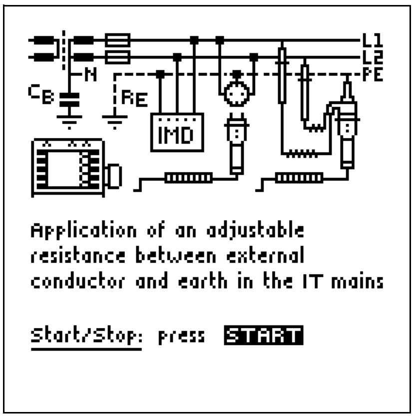
They're used in power supplies for which a single-pole earth fault may not result in failure of the power supply, for example in operating rooms or photovoltaic systems.

Insulation monitors can be tested with the help of this special function. After pressing the **ON/START ▼** key, an adjustable insulation resistance is activated between one of the two phases of the IT system to be monitored and ground to this end. This resistance can be changed in the **MAN±** manual sequence mode with the help of the **+** or **–** softkey, or varied automatically from R_{max} to R_{min} in the **AUTO** operating mode. Testing is ended by once again pressing the **ON/START ▼** key.

Time during which the momentary resistance value prevails since changing the value at the system is displayed. The IMD's display and response characteristics can be subsequently evaluated and documented with the help of the **OK** or **NOT OK** softkey.

Connection L – N

HELP



Application of an adjustable resistance between external conductor and earth in the IT mains

Start/Stop: press START

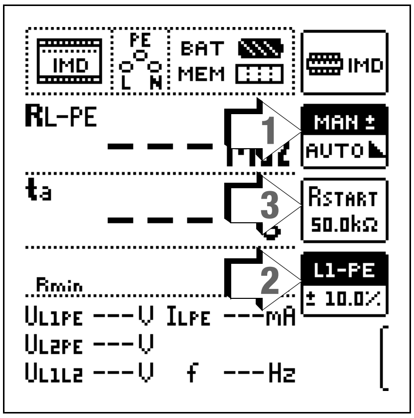
When selecting test resistance, don't forget that an excessively high test current could damage sensitive system components.

Set Parameters

Measuring Procedure (1)

There are two ways to conduct the test:

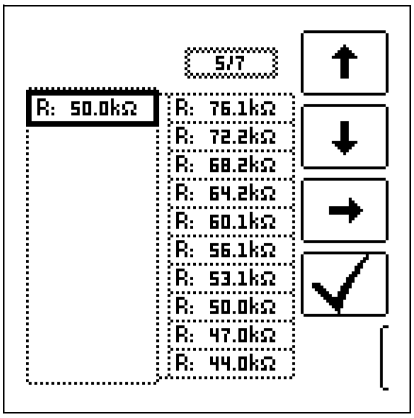
- **MAN:** Resistance is changed manually by tapping the respective softkeys.
- **AUTO:** Resistance is changed automatically every 2 seconds beginning with **RSTART**.



IΔN

Resistance RSTART (3)

Numerous parameters are available for setting resistance **RSTART**, with which measurement is begun.

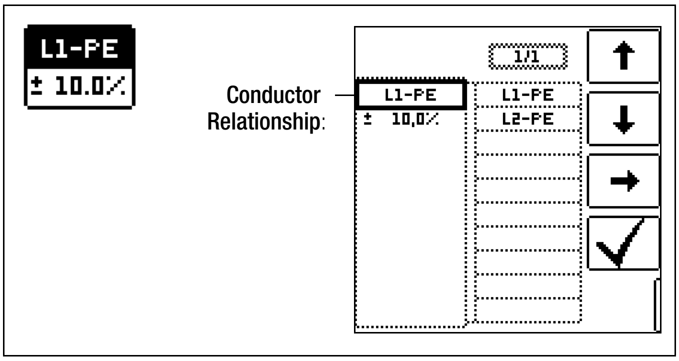


Conductor Relationship / Resistance Range (2)

- **Conductor relationship:** The corresponding conductor relationship can be selected for documentation of the measuring point.
- **Resistance range:** A range of values can be selected for testing the display of resistance at the IMD.

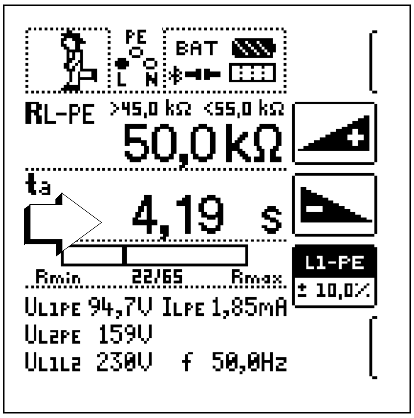
The parameter is set as a percentage with reference to the resistance momentarily introduced by the test instrument.

Upper and lower limit values are displayed in the measuring view.



Measuring Procedure

- ➪ Set the parameters.
- ➪ Start: Press the **ON/START ▼** key.
- ➪ A resistance is introduced between the phase and protective conductors and time measurement is started.
- ➪ **Manual test MAN + –**: press the ◢ or ◣ key to increase or reduce test resistance **RL-PE**.
- ➪ **Automatic test AUTO**: the resistance value is changed automatically.
- ➪ Time to trip **ta** is restarted each time resistance is changed.
- ➪ Press $I\Delta_N$ in order to change the conductor relationship.
- ➪ In order to end measurement, press the **ON/START ▼** key as soon as the IMD indicates that insulation resistance has been fallen short of.
- ➪ Display of measured values
- ➪ Evaluation query: Measurement **OK?**
- ➪ If evaluation is **NOT OK**: the **UL/RL** LED lights up red.
- ➪ Save: by pressing the soft key.



RL-PE >45,0 kΩ <55,0 kΩ
50,0 kΩ
ta 4,19 s
Rmin 22/65 Rmax
UL1PE 94,7V ILPE 1,85mA
UL2PE 159V
UL1L2 230V f 50,0Hz

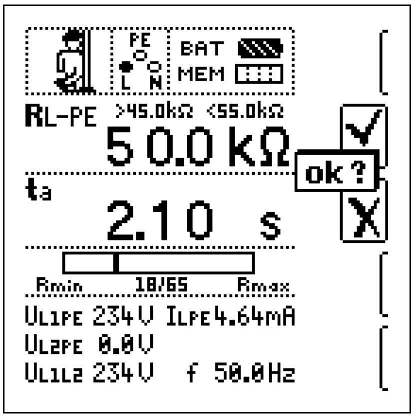
Measurement can be aborted by pressing the **ON/START ▼** or **ESC** key.

The following measured values are displayed:

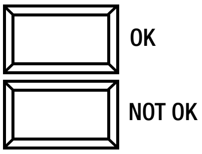
- **RL-PE**: Active test resistance with upper and lower limit values
- **t_a**: Response time (during which momentary resistance is applied until the measurement is ended)
- **R_{min} - R_{max}**: Status display indicating momentary resistance with reference to the number of possible resistances
- **U_{L1PE}**: Momentary voltage at the test probes between phase conductor L1 and protective conductor PE
- **U_{L2PE}**: Momentary voltage at the test probes between phase conductor L2 and protective conductor PE
- **U_{L1L2}**: Momentary voltage at the test probes between phase conductors L1 and L2
- **I_{LPE}**: Test current flowing through the active resistance
- **f**: Frequency of the applied voltage

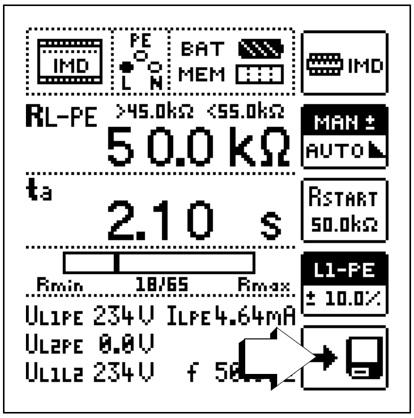
Evaluation

In order to evaluate the measurement, it must be stopped. This applies to manual as well as automatic measurement. Press the **ON/START ▼** or **ESC** key to this end. The stopwatch is stopped and the evaluation window appears.



RL-PE >45.0kΩ <55.0kΩ
50.0 kΩ
ta 2.10 s
Rmin 18/65 Rmax
UL1PE 234V ILPE 4.64mA
UL2PE 0.0V
UL1L2 234V f 50.0Hz

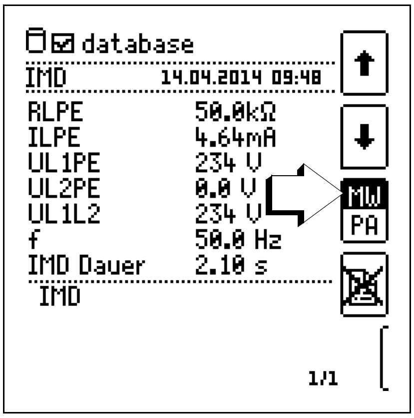




RL-PE >45.0kΩ <55.0kΩ
50.0 kΩ
ta 2.10 s
Rmin 18/65 Rmax
UL1PE 234V ILPE 4.64mA
UL2PE 0.0V
UL1L2 234V f 50

Retrieving Saved Measured Values

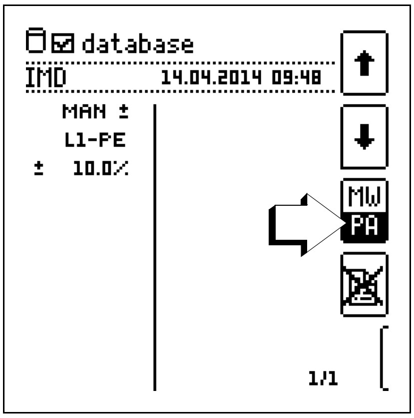
The measured value cannot be saved to memory and included in the test report until it has been evaluated (see also section 9.4).



IMD 14.04.2014 09:48

RLPE	50.0kΩ
ILPE	4.64mA
UL1PE	234 V
UL2PE	0.0 V
UL1L2	234 V
f	50.0 Hz
IMD Dauer	2.10 s

IMD



IMD 14.04.2014 09:48
MAN ±
L1-PE
± 10.0%

With the help of the key shown at the right (**MW**: measured value / **PA**: parameter), the setting parameters can be displayed for this measurement.

19.6 Residual Voltage Test – U_{res} Function (PROFITEST MXTRA only)

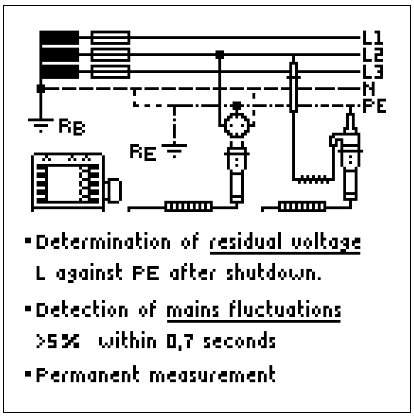
Application

The EN 60204 standard specifies that after switching supply power off, residual voltage must drop to a value of 60 V or less within 5 seconds at all accessible, active components of a machine to which a voltage of greater than 60 V is applied during operation.

Testing for the absence of voltage is performed as follows with the test instrument by means of a voltage measurement which involves the measurement of discharge time:
In the case of voltage dips of greater than 5% of momentary line voltage (within 0.7 seconds), the stopwatch is started and momentary undervoltage is displayed as **U_{res}** after 5 seconds and indicated by the red UL/RL LED.

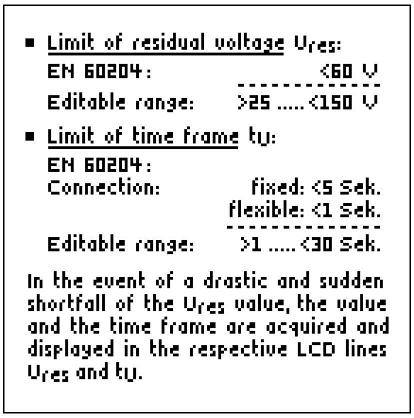
The function is ended after 30 seconds after which Ures and tu data can be deleted and the function can thus be restarted by pressing the ESC key.

Connection



- Determination of residual voltage L against PE after shutdown.
- Detection of mains fluctuations >5% within 0,7 seconds
- Permanent measurement

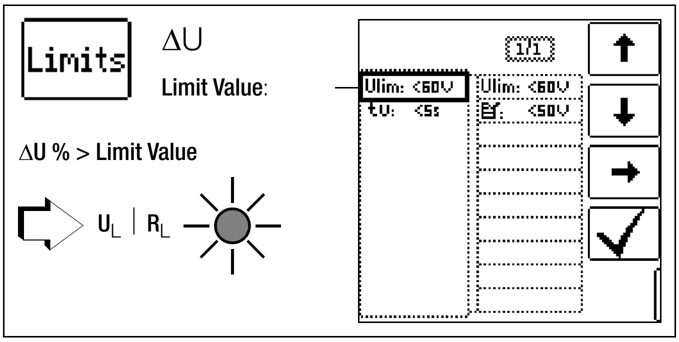
Limit Values



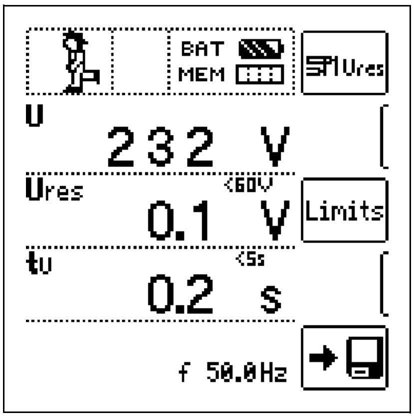
- Limit of residual voltage Ures:
  EN 60204: <60 V
  Editable range: >25 ..... <150 V
- Limit of time frame tU:
  EN 60204:
  Connection: fixed: <5 Sek.
  flexible: <1 Sek.
  Editable range: >1 ..... <30 Sek.

In the event of a drastic and sudden shortfall of the Ures value, the value and the time frame are acquired and displayed in the respective LCD lines Ures and tU.

Set Limit Values



Measuring Sequence – Long-Term Measurement



Testing is selected as a continuous measurement because residual voltage testing is triggered automatically and voltage measurement is always active for safety reasons.

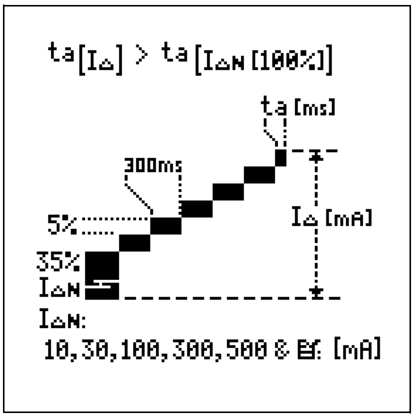
☞ **Note**
If, for example, conductors are exposed when a machine is switched off – e.g. if plug connectors are disengaged – which are not protected against direct contact, maximum permissible discharge time is 1 second!

19.7 Intelligent Ramp – ta+IΔ Function (PROFITEST MXTRA only)

Application

The advantage of this measuring function in contrast to individual measurement of $I_{\Delta N}$ and t_A is the simultaneous measurement of breaking time and breaking current by means of a test current which is increased in steps, during which the RCD is tripped only once.

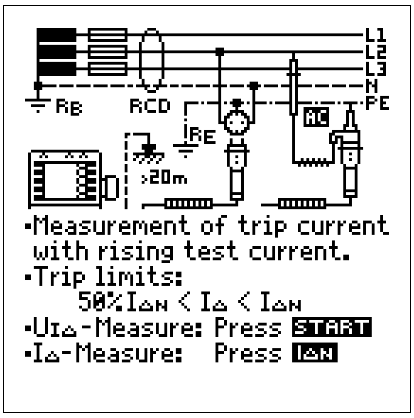
The intelligent ramp is subdivided into time segments of 300 ms each between the initial current value (35% $I_{\Delta N}$) and the final current value (130% $I_{\Delta N}$). This results in a gradation for which each step corresponds to a constant test current which is applied for no longer than 300 ms, assuming that tripping does not occur.



And thus both tripping current and tripping time are measured and displayed. Measured quantities are acquired with reduced accuracy.

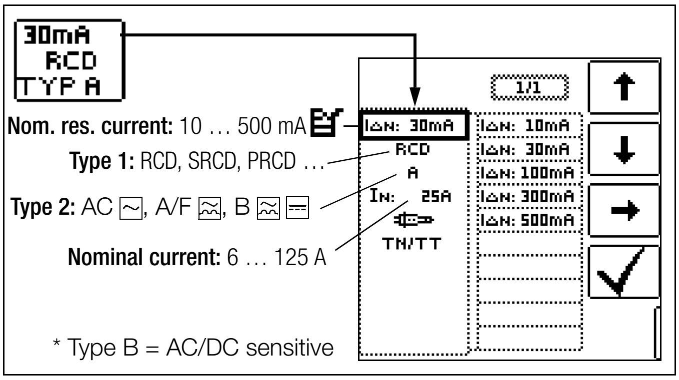
Connection

HELP



•Measurement of trip current with rising test current.
•Trip limits:
50%IΔN < IΔ < IΔN
•UIΔ-Measure: Press START
•IΔ-Measure: Press IΔN

Set Parameters



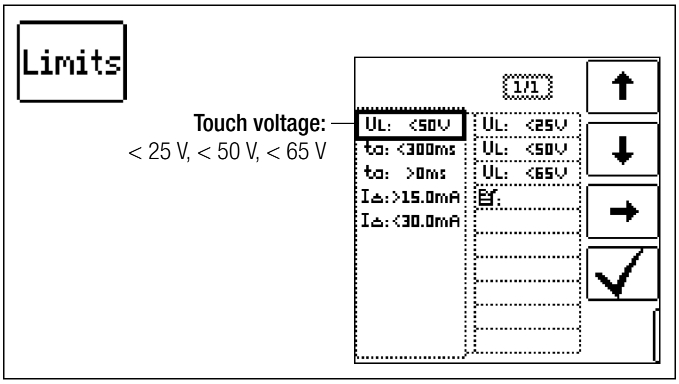
Nom. res. current: 10 … 500 mA EF

Type 1: RCD, SRCD, PRCD …

Type 2: AC ⏦, A/F, B

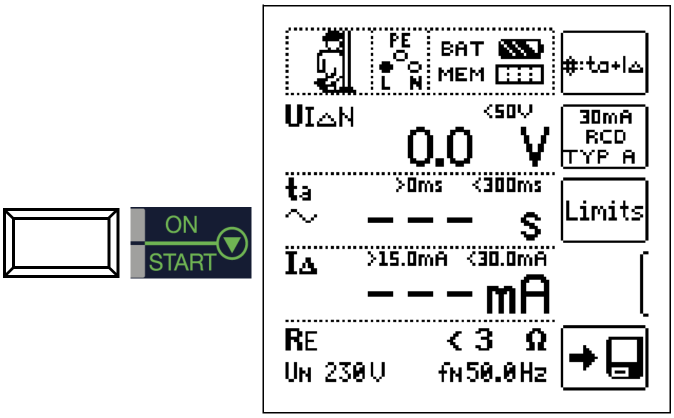
Nominal current: 6 … 125 A

* Type B = AC/DC sensitive

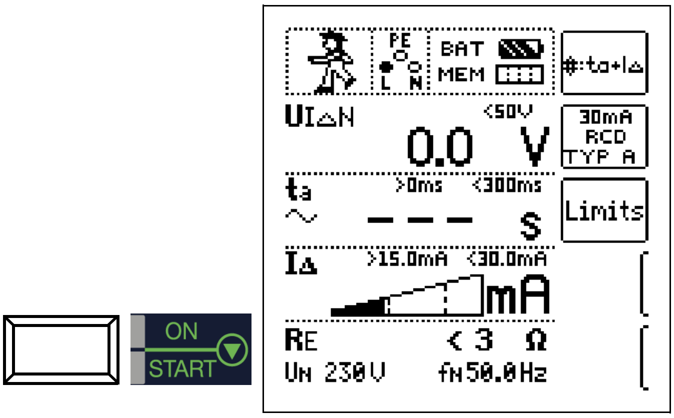


Touch voltage:
< 25 V, < 50 V, < 65 V

Start Touch Voltage Measurement

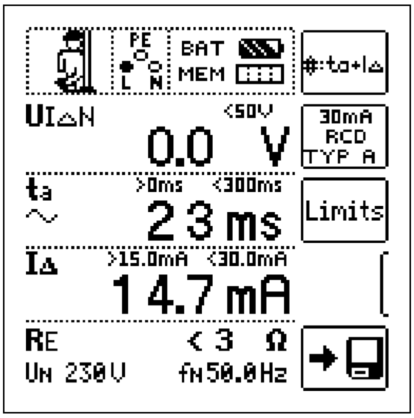


Start Tripping Test



The measurement sequence can be broke off prematurely at any time by pressing the **ON/START ▼** key.

Measurement Results



19.8 Testing Residual Current Monitors – RCM Function (PROFITEST MXTRA only)

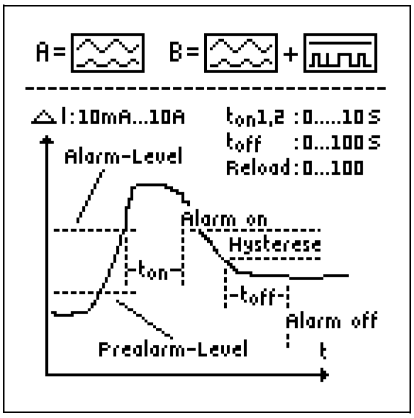
General

Residual current monitors (RCMs) monitor residual current in electrical systems and display it continuously. As is also the case with residual current devices, external switching devices can be controlled in order to shut down supply power in the event that a specified residual current value is exceeded.

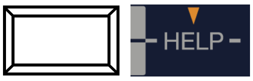
However, the advantage of an RCM is that the user is informed of fault current within the system before shutdown takes place.

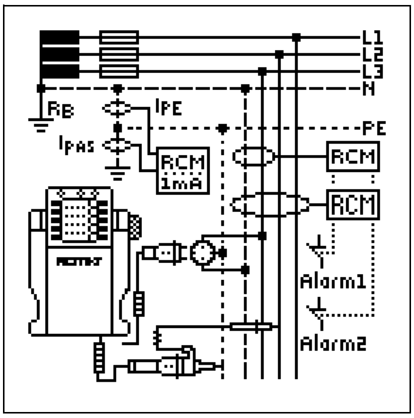
As opposed to individual measurement of $I_{\Delta N}$ and t_A, measurement results must be evaluated manually in this case.

If an RCM is used in combination with an external switching device, the combination must be tested as if it were an RCD.

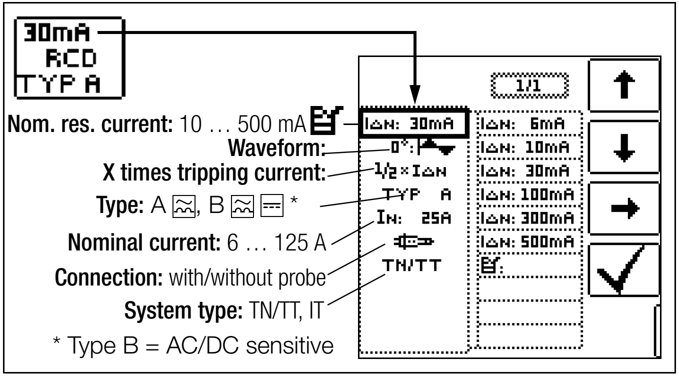


Connection

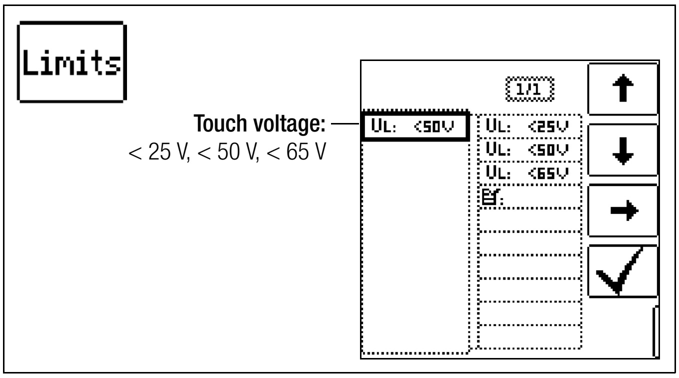




Set Parameters for $I_{F\Delta}$

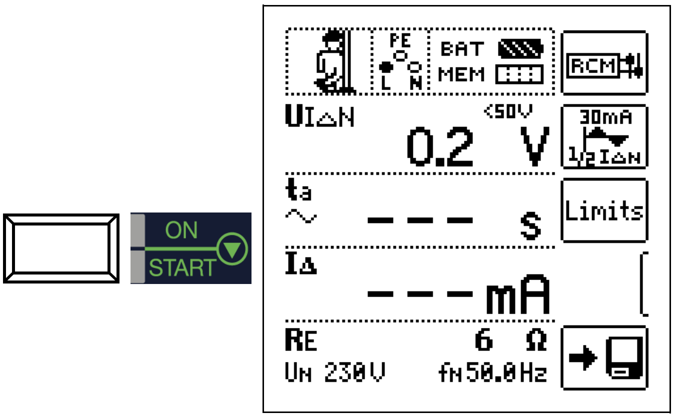


Nom. res. current: 10 … 500 mA
Waveform:
X times tripping current:
Type: A, B *
Nominal current: 6 … 125 A
Connection: with/without probe
System type: TN/TT, IT
* Type B = AC/DC sensitive

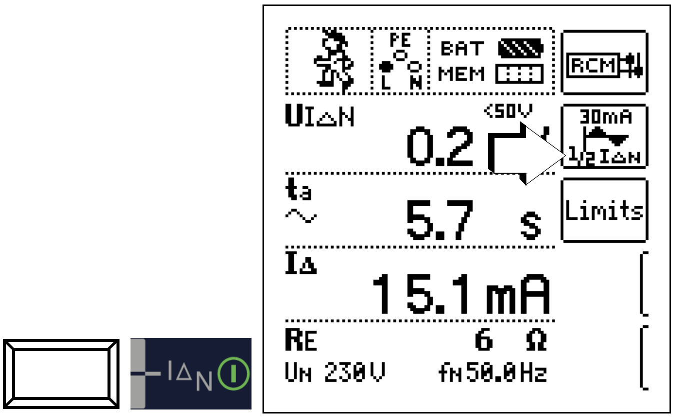


Touch voltage:
< 25 V, < 50 V, < 65 V

Measure Touch Voltage



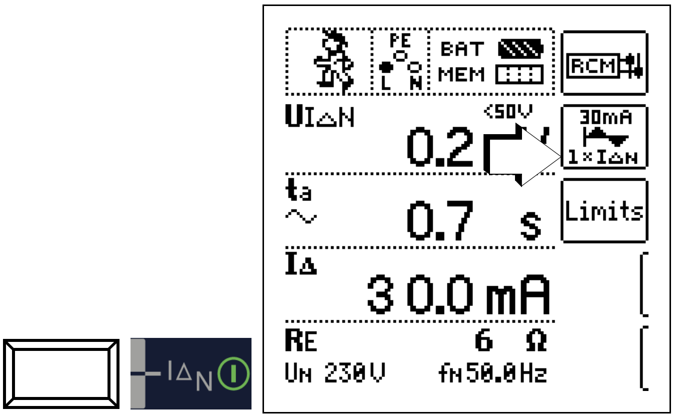
No-Trip Test with ½ × $I_{\Delta N}$ and 10 s



After 10 seconds have elapsed, no residual current may be indicated. The measurement must then be evaluated. In the event that “**NOT OK**” is selected (in case of false alarm), an error is indicated by the **UL/RL** LED which lights up red.

The measured value cannot be saved to memory and included in the test report until it has been evaluated.

Tripping test with 1 × $I_{\Delta N}$ – Measurement of Signal Response Time (Stopwatch Function) with Residual Current Generated by the Test Instrument



Measurement must be stopped manually by pressing the **ON/ START ▼** or **$I_{\Delta N}$** key immediately after indication of residual current, in order to document tripping time.

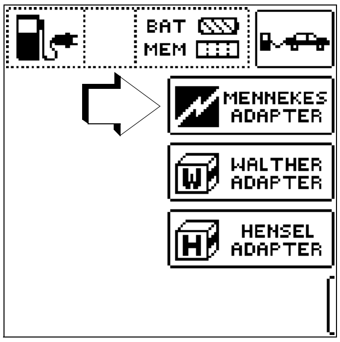
In the event that **NOT OK** is selected, an error is indicated by the **UL/ RL** LED which lights up red.

The measured value cannot be saved to memory and included in the test report until it has been evaluated.

19.9 Checking the Operating Statuses of Electric Vehicles at Charging Stations per IEC 61851 ((PROFITEST MTECH+ & PROFITEST MXTRA)

A charging station is a facility designed to charge electric vehicles in accordance with IEC 61851-1, and is equipped with essential elements including a plug connector, conductor protection, an RCD, a circuit breaker and a safety communication device (PWM). Depending on where it's used, other function modules may be added, for example for mains connection and metering.

Selecting the Adapter (test box)



Simulation of Operating Statuses per IEC 61851-1 with the MENNEKES Test Box

(Statuses A through E)

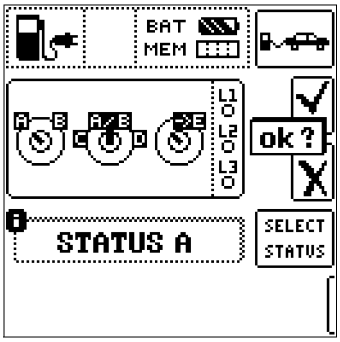
The MENNEKES test box is used exclusively to simulate the various operating statuses of a fictitious electric vehicle connected to a charging station. Settings for the simulated operating statuses can be found in the operating instructions for the test box.

The simulated operating statuses can be saved to as a visual inspection and documented in the report generating program.

Select the respective status to be checked with the **SECLECT STATUS** key at the test instrument.

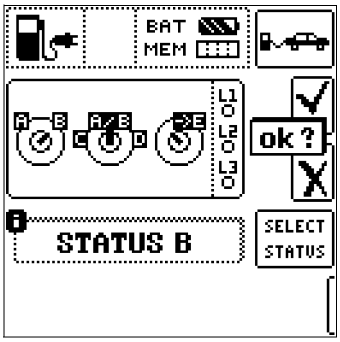
Status A – charging cable connected to charging point only

- CP signal is activated.
- Voltage between PE and CP is 12 V.



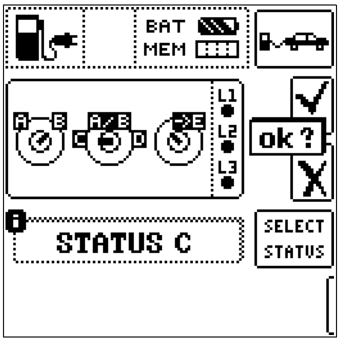
Status B – charging cable connected to charging point and vehicle

- Charging cable is locked into place at the charging point and the vehicle.
- Vehicle is not yet ready for charging.
- Voltage between PE and CP: +9 V / -12 V



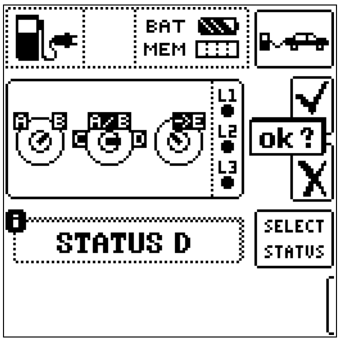
Status C – non-gassing vehicle detected

- Vehicle is ready for charging / power is connected
- Voltage between PE and CP: +6 V / -12 V



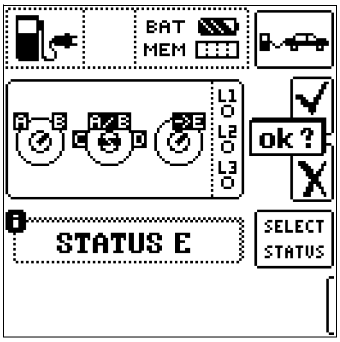
Status D – gassing vehicle detected

- Vehicle is ready for charging / power is connected
- Voltage between PE and CP: +3 V / -12 V

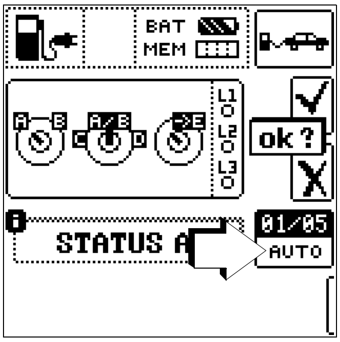


Status E – cable is damaged

- Short-circuit between PE and CP
- Charging cable is unlocked at the charging point.
- Voltage between PE and CP is +0 V.



Semi-Automatic Changing of Operating Statuses



As an alternative to manual status changing via the parameters menu for the **SECLECT STATUS** softkey at the test instrument, quick and convenient switching amongst the statuses is also possible. The **AUTO** status parameter has to be selected to this end. After responding to the visual inspection prompt and saving the results, automatic switching to the next status ensues – the **01/05** key display corresponds to A/E (**01** = A, **02** = B, **03** = C, **04** = D, **05** = E).

Status variants can be skipped by pressing the **$I_{\Delta N}$** key at the test instrument or the test plug.

19.10 PRCD – Test Sequences for Documenting Fault Simulations at PRCDs with the PROFITEST PRCD Adapter (PROFITEST MXTRA only)

The PROFITEST PRCD test adapter can be used in combination with the test instrument.

Attention!

Read the respective operating instructions before using the PROFITEST PRCD.

Measurements with the PROFITEST PRCD connected to the test instrument:

- Measurement of the PRCD's insulation resistance using the test instrument's R_{INS} function (see section 16).
- Measurement of the PRCD's protective conductor resistance using the test instrument's R_{LO} function. Please note that the protective conductor measurement is a modified RLO measurement with ramp sequence for PRCDs (seesection 17).
- Tripping test with nominal residual current using the test instrument's I_F ◢ function (see section 12.3).
- Measurement of time to trip using the test instrument's $I_{\Delta N}$ function (see section 12.3).
- Varistor test for PRCD-K: measurement via ISO ramp (see section 16).

Testing performed by simulating faults is carried out without connection to the test instrument, but it's accompanied and documented by the test instrument. The test sequence is opened in the test instrument to this end and the specified steps are executed at the PROFITEST PRCD. Afterwards, evaluation and assessment of each test step (OK or not OK) is performed at the test instrument for later documentation.

There are three preset test sequences:
– PRCD-S (single-phase / 3-pole): 11 test steps
– PRCD-K (single-phase / 3-pole): 4 test steps
– PRCD-S (3-phase / 5-pole): 18 test steps

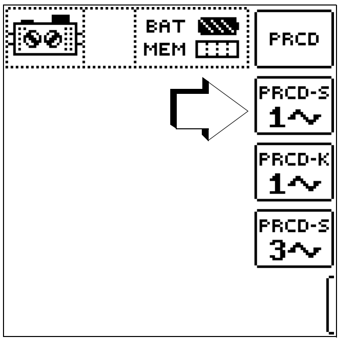
19.10.1 Fault Simulation

The procedure for the PROFITEST PRCD, including the procedure with the device under test, is described in the operating instructions for the PROFITEST PRCD. This section describes the procedure for the test instrument.

Procedure

- ➪ Prepare error simulation at the PROFITEST PRCD. Refer to the operating instructions for the PROFITEST PRCD.
- ➪ Select the test sequence at the test instrument.
- ➪ Execute each of the test sequence steps at the PROFITEST PRCD and document evaluation and assessment at the test instrument.

Select the PRCD to be Tested



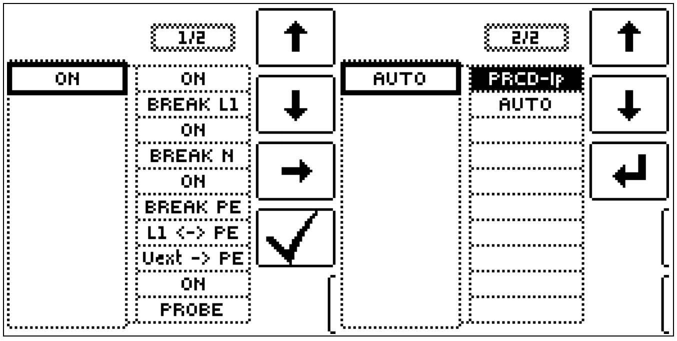
Interaction Between PROFITEST PRCD and Test Instrument

Switch Position at PROFITEST PRCD	Display at Test Instrument		Meaning
	Test Step	Icon	
ON	ON	1~ON	Single-phase PRCD activated
ON	ON	3~ON	3-phase PRCD activated
	BREAK Lx		Interrupted phase
↻	Lx <-> PE Lx <-> N	↻	Wires reversed between phase conductor and PE or neutral conductor
PE-U_{EXT}	Uext -> PE	PE-UEXT	PE to phase
ON	PROBE	ON	Contact **ON** key on PRCD with probe
ON	PRCD-Ip	ON	Protective conductor current measurement with current clamp transformer
—	AUTO	AUTO	Semi-automatic change of fault simulations

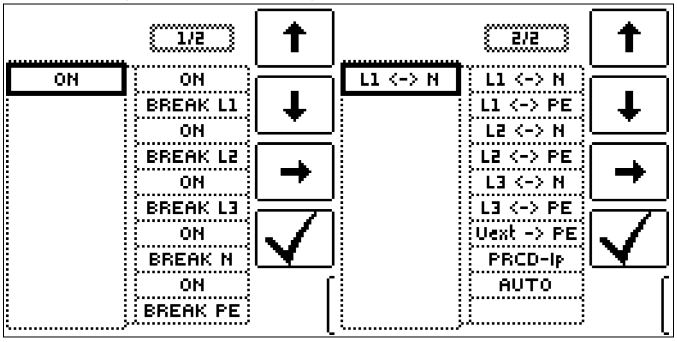
The test steps are displayed at the test instrument. Their meanings and the associated switch positions at the PROFITEST PRCD are listed in the above table.

Overview of Test Sequences and their Test Steps

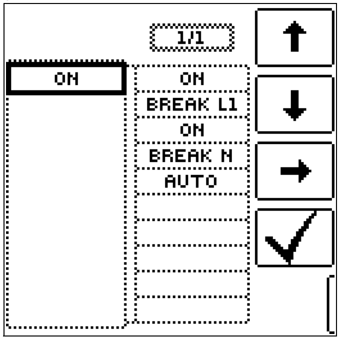
PRCD-S, single-phase: 11 test steps



PRCD-S, 3-phase: 18 test steps

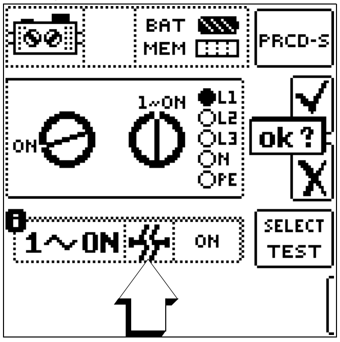


PRCD-K, single-phase: 5 test steps

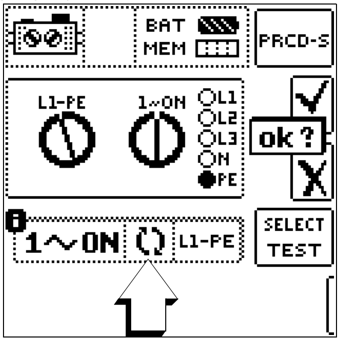


Selection Examples, PRCD-S Test Sequence (single-phase) – 11 Test Steps

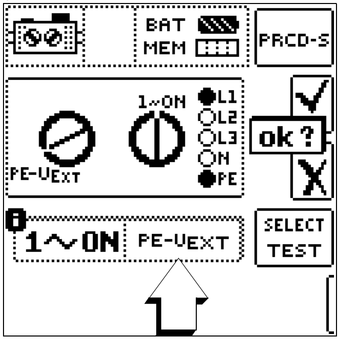
Simulation of Interruption (steps 1 to 6)



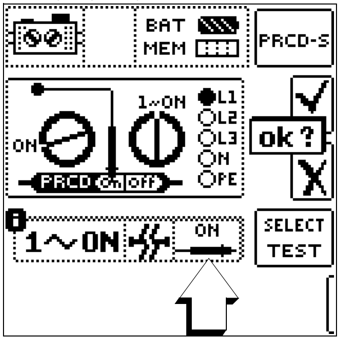
Reversed Conductor Simulation (step 7)



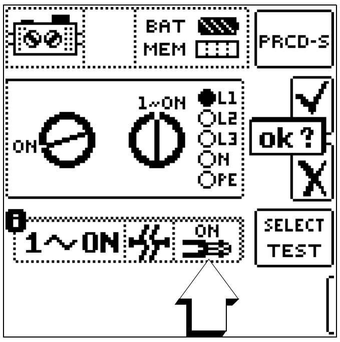
Simulation of PE to Phase (step 8)



Contact ON Key at PRCD with Probe (step 10)

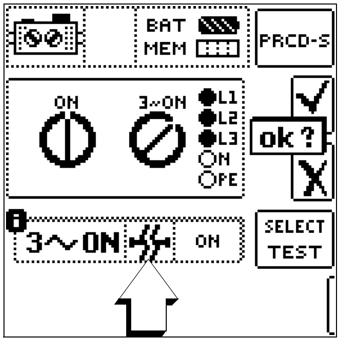


Measurement of Protective Conductor Current with a Current Clamp Transformer (step 11)

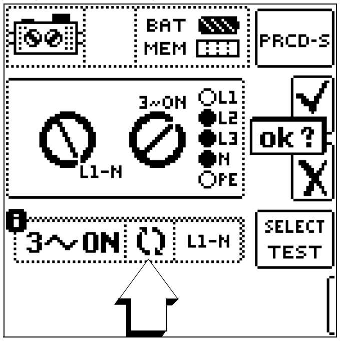


Selection Examples, PRCD-S Test Sequence (3-phase) – 18 Test Steps

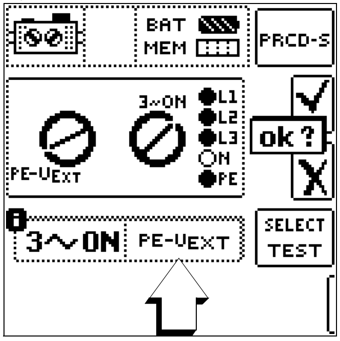
Simulation of Interruption (steps 1 to 10)



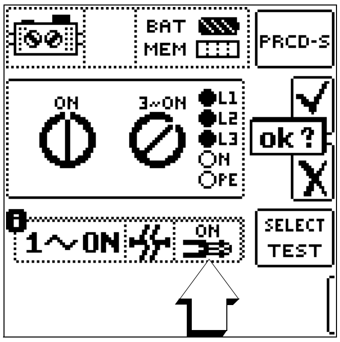
Reversed Conductor Simulation (steps 11 to 16)



Simulation of PE to Phase (step 17)

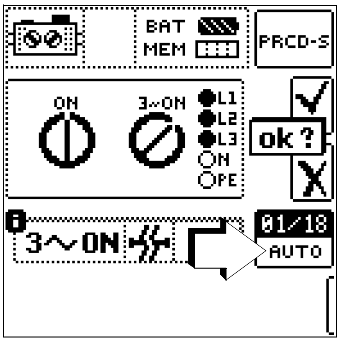


Measurement of Protective Conductor Current with a Current Clamp Transformer (step 18)



Semi-Automatic Changing of Fault Simulations (Statuses)

As an alternative to manual status changing via the parameters menu for the respective PRCD selection at the test instrument (**PRCD-S 1~, PRCD-K 1~** or **PRCD-S 3~**), quick and convenient switching amongst the fault simulations is also possible. The **AUTO** status parameter has to be selected to this end. After responding to the visual inspection prompt and saving the results, automatic switching to the next fault simulation ensues.

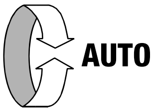


Skipping Test Steps

Test steps can be skipped during fault simulation by pressing the $\mathbf{I}_{\Delta N}$ key at the test instrument or the test plug.

20 Test Sequences (Automatic Test Sequences) – AUTO Function

Select AUTO Switch Position at the Test Instrument



With the rotary switch in the **AUTO** position, all of the test sequences in the device are displayed.

If there aren't any test sequences in the instrument, **NO DATA** appears.

20.1 General (test sequence layouts)

If the same sequence of tests will be run frequently (one after the other with subsequent report generation), for example as specified in the standards, it's advisable to make use of test sequences.

Automated test sequences can be compiled from manually created individual measurements with the help of the test sequence function.

A test sequence consists of up to 200 individual steps, which are executed one after the other.
Fundamentally, differentiation is made amongst three types of individual steps:

- Note (**Visual Inspection** test step) Test sequences are interrupted when a pop-up message is displayed for the inspector. The test sequences is not resumed until the message has been acknowledged.
  Sample Message Before Insulation Resistance Measurement "Disconnect the device from the mains!"
- Visual inspection, testing and report generation: The test sequence is interrupted when a passed/failed evaluation is displayed. The comment and the results of the evaluation are saved to the database.
- Measurement ("**User-Evaluated Measurement**" test step): same as individual measurements with instruments with storage and parameters configuration

20.2 Creation of Test Sequences with ETC

The test sequences are created at the PC with the help of ETC software, and are then transferred to the test instrument.

Measurement parameters are also configured at the PC. However, parameters can be changed at the test instrument during the test sequence before the respective measurement is started.

When the test step is started once more, the parameter settings specified in ETC are loaded again.

ETC does not subject the parameters to a plausibility check. As a result, the newly created test sequence should be checked at the test instrument before it's permanently added to the database.

Limit values are not currently set in ETC, and have to be adjusted during the automatic test.
Accessing the Menu for Editing Test Sequences

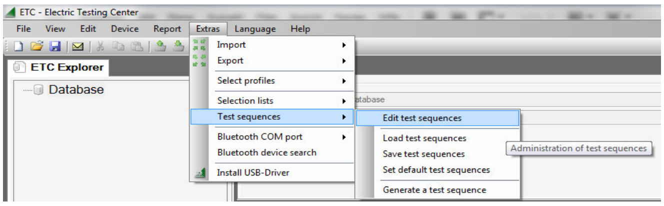
In order to be able to edit existing test sequences (e.g. add test steps or change parameter settings), they first have to be loaded to ETC.

There are two ways to do this:

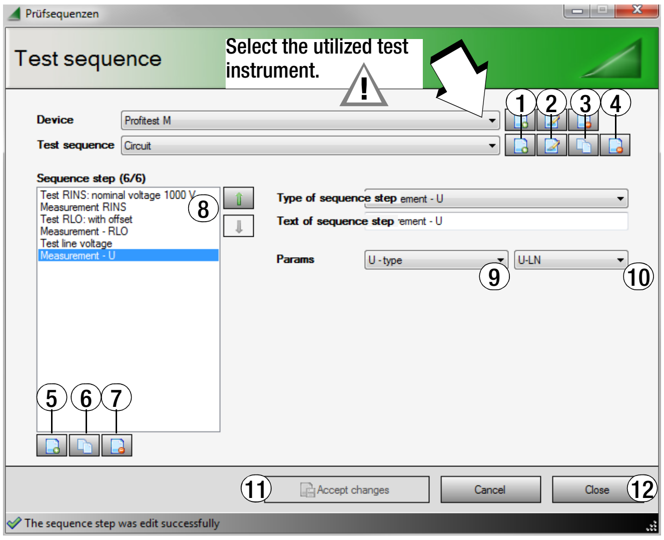
- ETC: Extras → Test Sequences → Load Test Sequences (from the file "test_sequence_xyz.seq")

or

- ETC: Device → Test Sequences → Receive Test Sequences (from the connected test instrument)



Operating Overview: Creating Test Sequences at a PC



Device: Profitest M

Test sequence: Circuit

Sequence step (6/6)

Test RINS: nominal voltage 1000 V
Measurement RINS
Test RLO: with offset
Measurement - RLO
Test line voltage
Measurement - U

Type of sequence step: ement - U

Text of sequence step: ement - U

Params: U - type, U-LN

The sequence step was edit successfully

1 Create a new test sequence – enter a designation.
2 Change the designation of the selected test sequence.
3 Duplicate the selected test sequence,
(Copy) is added to the name of the duplicated sequence.
4 Delete the selected test sequence.
5 Create or add a new test step for the selected test sequence.
– Select the test step type from the list to this end and either accept or edit its designation.
6 Duplicate the selected test step.
7 Delete the selected test step.
8 Change position of the selected test step within the sequence.
9 Select test parameters for the selected test step type from the list.
10 Select a setting for the measuring parameter from the list.
11 Accept change to the measuring parameter.
12 Exit the test sequences menu.

Saving Test Sequences in ETC to the PC

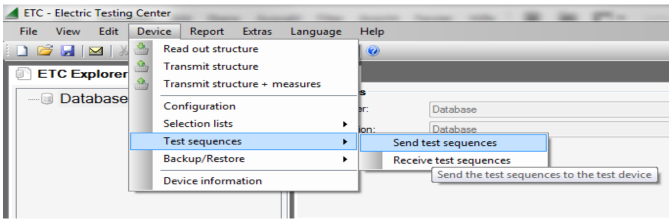
We recommend saving default test sequences, as well as edited and new test sequences, to the PC or to other data storage media using the desired filename (test_sequence_xyz.seq) with the help of the following menu command: Extras → Test Sequences → Save Test Sequences. Data loss resulting from certain administrative operations is prevented in this way (see following notes).

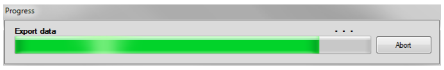
Due to the fact that only up to 10 test sequences, can be transferred to the test instrument, no more than 10 test sequences should be saved to any given file.

Test sequences which have been saved to a file can be reloaded to ETC at any time by clicking "Extras → Test Sequences → Load Test Sequences".
Sequences can be further edited by clicking
"Extras → Test Sequences → Edit Test Sequences".

Transferring Test Sequences from the PC to the Test Instrument

After executing the following ETC command, all previously created test sequences (up to 10) are transferred to the connected test instrument: "Device → Test Sequences → Send Test Sequences".

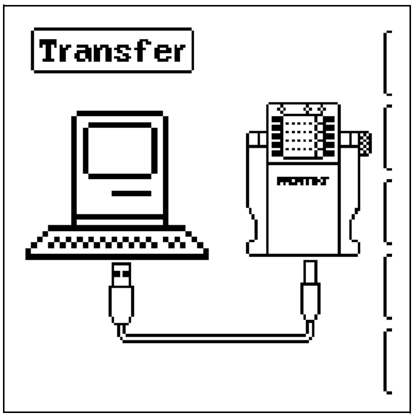




⚠ **Attention!**

Test sequences which have been loaded to the test instrument are deleted when:

- **New test sequences are received from the PC**
- **Selection lists are received from the PC**
- **Backup data is restored to the test instrument**
- **The user interface language is changed**
- **The test instrument's entire database is deleted**
- **The test instrument is reset to its default settings**
- **The firmware is updated**



For as long as the test sequences are being transferred, a progress bar is displayed at the PC and the illustration shown to the right appears at the test instrument's display.

After data transmission has been completed, the display is switched to the **database** memory menu.

The display is returned to the measuring menu for the respective switch position by clicking **ESC**.

20.3 Using Test Sequences

Test Sequence Commands

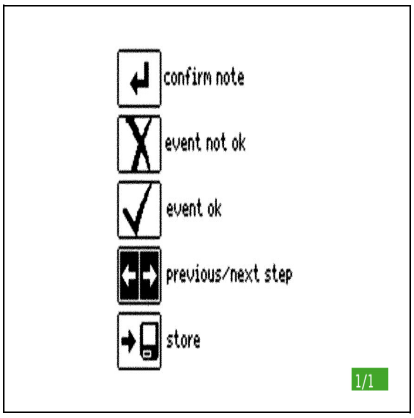
Acknowledge message

Discard event

Confirm event

To previous / to next step

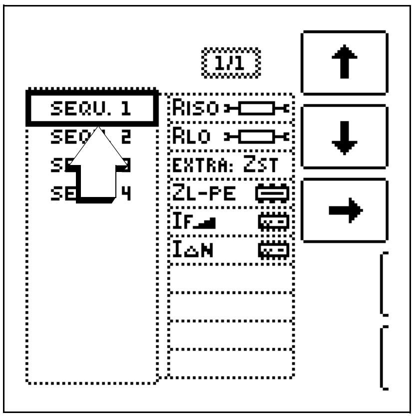
Save measurement results



Configuring Test Sequence Parameters

Measurement parameters are also configured at the PC. However, parameters can be changed at the test instrument during the test sequence before the respective measurement is started.

Selecting and Starting a Test Sequence at the Test Instrument



The selected test sequence (**SEQU.1** in this case) is started with the **ON/START** ▼ key.

When a test step of the measurement type is executed, the same screen layout appears as is also the case for individual measurements. The current test step number appears in the header instead of the memory and battery icons. After pressing the **Save** key twice, the next test step is displayed.

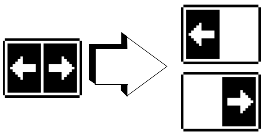
Setting Parameters and Limit Values

Parameters and limit values can also be changed while a test sequence is running or before the respective measurement is started. The respective change only affects the active test sequence and is not saved.

Skipping Test Steps

There are two ways to skip test steps or individual measurements:

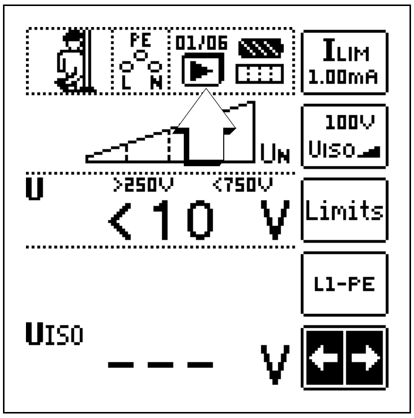
- Select the test sequence, change to the test step column at the right with the help of the cursor, select the x^{th} test step and press the **ON/START** ▼ key.
- The navigation menu can be opened within the test sequence by pressing the navigation key (cursor left-right). Jumping to the next or the previous test step is possible using the separate scroll keys which then appear.
  The navigation menu can be exited again and the current test step can be displayed by pressing the **ESC** key.



Aborting or Ending a Test Sequence

An active sequence can be aborted by pressing the **ESC** key and then acknowledging.

Sequence Ended appears after the last test step is completed. The initial menu, **List of Test Sequences**, is once again displayed after acknowledging the prompt.



21 Maintenance

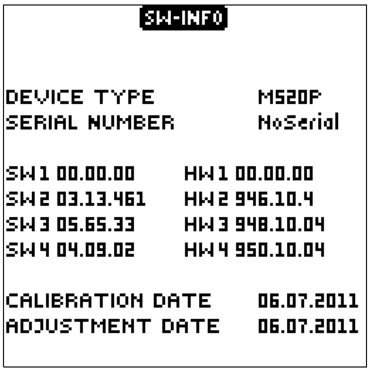
21.1 Test Instrument Firmware/Software

The layout of the test instruments makes it possible to adapt device software to the latest standards and regulations. Beyond this, suggestions from customers result in continuous improvement of the test instrument software, as well as new functions.

Query Current Status

➪ Turn the rotary switch to the **SETUP** position.

➪ Press the **SW-Info CALIBRATION** key.



```
            SW-INFO

DEVICE TYPE          M520P
SERIAL NUMBER        NoSerial

SW1 00.00.00     HW1 00.00.00
SW2 03.13.461    HW2 946.10.4
SW3 05.65.33     HW3 948.10.04
SW4 04.09.02     HW4 950.10.04

CALIBRATION DATE     06.07.2011
ADJUSTMENT DATE      06.07.2011
```

➪ Press any key in order to return to the main menu.

Update

Internal test instrument firmware/software can be updated via the USB port with the help of a PC and an interface cable.

The firmware/software with the required version is transferred to the test instrument with the help of the MASTER Updater Software-Tool. Currently installed test instrument firmware/software is overwritten.

The MASTER Updater can be downloaded free of charge from www.gossenmetrawatt.com. Registration with myGMC is required to this end. Operating instructions for the Firmware Update Tool are available here as well.

Note

Prerequisite for transfer:
The rotary selector switch is <u>not</u> set to the **U** position.

➪ Establish a USB connection between the PC and the test instrument.

➪ Switch the PC and the test instrument on.

➪ Follow the instructions displayed by the MASTER Updater and the associated operating instructions.

21.1.1 Rechargeable Battery Care

Check to make sure that no leakage has occurred at the rechargeable batteries at short, regular intervals, or after the instrument has been in storage for a lengthy period of time.

Note

Remove rechargeable batteries during lengthy periods of non-use (e.g. vacation). This prevents excessive depletion or leakage, which may result in damage to the test instrument.

21.2 Fuse Replacement

If a fuse has blown due to overloading, a corresponding message error appears at the display panel. The instrument's voltage measuring ranges are nevertheless still functional.

➪ Disconnect the device from the measuring circuit at all poles!

➪ Loosen the slotted screws at the fuse compartment lid next to the mains power cable with a screwdriver. The fuses are now accessible.

➪ Replacement fuses can be accessed after opening the battery compartment lid.

⚠ **Attention!**

Severe damage to the instrument may occur if incorrect fuses are used.
Only original fuses from Gossen Metrawatt GmbH may be used (order no. 3-578-285-01 / SIBA 7012540.3.15 SI-EINSATZ FF 3.15/500 6.3X32).
Only original fuses assure required protection by means of suitable blowing characteristics. Short-circuiting of fuse terminals or the repair of fuses is prohibited, and is life endangering!
The instrument may be damaged if fuses with incorrect ampere ratings, breaking capacities or blowing characteristics are used!

➪ Remove the blown fuse and insert a new one.

➪ Insert the fuse compartment lid after the fuse has been replaced and secure it by turning clockwise.

21.3 Housing

No special maintenance is required for the housing.

Keep outside surfaces clean. Use a slightly dampened cloth for cleaning. In particular for the protective rubber surfaces, we recommend a moist, lint-free microfiber cloth. Avoid the use of cleansers, abrasives or solvents.

21.4 Calibration

Use of your instrument and resultant stressing influence the instrument and lead to deviation from warranted accuracy values.

In the case of strict measuring accuracy requirements, as well as in the event of severe stressing (e.g. severe climatic or mechanical stress), we recommend a relatively short calibration interval of once per year. If this is not the case, a calibration interval of 2 to 3 years is usually adequate.

Please contact GMC-I Service GmbH for calibration services (see section 22, "Contact, Support and Service", on page 99).

A sticker with an instrument-specific guideline value for the calibration interval and information regarding the service provider is included on the instrument as an aid.

Note

Date on Calibration Certificate / Calibration Interval Begins Upon Receipt

Your instrument is furnished with a calibration certificate on which a date appears. This date may be further in the past if your instrument has been stored for some time prior to sale.
The instruments are stored in accordance with the specified conditions. Drift is thus negligible for a duration of 1 year. Longer storage periods are highly unusual. Consequently, the instrument's characteristic values lie within the specifications and the first calibration interval can be determined as of the date of receipt.

22 Contact, Support and Service

Gossen Metrawatt GmbH can be reached directly and simply – we have a single number for everything! Whether you require support or training, or have an individual inquiry, we can answer all of your questions here:

+49-911-8602-0

Monday to Thursday:	8 a.m. to 4 p.m.
Friday:	8 a.m. to 2 p.m.

Or contact us by e-mail at:

info@gossenmetrawatt.com

Do you prefer support by e-mail?

24 Disposal and Environmental Protection

Proper disposal makes an important contribution to the protection of our environment and the conservation of natural resources.

Attention!

Environmental Damage
Improper disposal results in environmental damage.
Follow the instructions concerning return and disposal included in this section.

The following comments refer specifically to the legal situation in the Federal Republic of Germany. Owners or end users who are subject to other national requirements are required to comply with the respectively applicable national requirements and to implement them correctly on site. Relevant information can be obtained, for example, from the responsible national authorities or national distributors.

Waste Electrical Equipment, Electrical or Electronic Accessories and Waste Batteries (including rechargeable batteries)

Electrical equipment and batteries (including rechargeable batteries) contain valuable raw materials that can be recycled, as well as hazardous substances which can cause serious harm to human health and the environment, and they must be recycled and disposed of correctly.

The symbol on the left depicting a crossed-out garbage can on wheels refers to the legal obligation of the owner or end user (German electrical and electronic equipment act ElektroG and German battery act BattG) not to dispose of used electrical equipment and batteries with unsorted municipal waste (“household trash”). Waste batteries must be removed from the old device (where possible) without destroying them and the old device and the waste batteries must be disposed of separately. The battery type and its chemical composition are indicated on the battery’s labelling. If the abbreviations “Pb” for lead, “Cd” for cadmium or “Hg” for mercury are included, the battery exceeds the limit for the respective metal.

Please observe the owner’s or end user’s responsibility with regard to deleting personal data, as well as any other sensitive data, from old devices before disposal.

Old devices, electrical or electronic accessories and waste batteries (including rechargeable batteries) used in Germany can be returned free of charge to Gossen Metrawatt GmbH or the service provider responsible for their disposal in compliance with applicable regulations, in particular laws concerning packaging and hazardous goods. Further information regarding returns can be found on our website.

Packaging Materials

We recommend retaining the respective packaging materials for the case that you might require servicing or calibration in the future.

Attention!

Danger of Asphyxiation Resulting from Foils and Other Packaging Materials
Children and other vulnerable persons may suffocate if they wrap themselves in packaging materials, or their components or foils, or if they pull them over their heads or swallow them.
Keep packaging materials, as well as their components and foils, out of the reach of babies, children and other vulnerable persons.

In accordance with German packaging law (VerpackG), the user is obligated to correctly dispose of packaging and its components separately, and not together with unsorted municipal waste (“household trash”).

Private end consumers can dispose of packaging free of charge at the responsible collection point. Packaging which is not subject to so-called system participation is returned to the appointed service provider. Further information regarding returns can be found on our website.

160	930	1.12 k									2240	3.18 k

Example

Display value of 90.4 A → next lower value for circuit breaker characteristic B from table: 85 A → nominal current (I_N) of the protective device: max. 16 A

25.2 At which values should/must an RCD actually be tripped? Requirements for Residual Current Devices (RCD)

General Requirements

- Tripping must occur no later than upon occurrence of rated residual current (nominal differential current $I_{\Delta N}$).

and

- Maximum time to trip may not be exceeded.

Additional requirements due to influences on the tripping current range and the point in time of tripping which have to be taken into consideration:

- Residual current type or waveform:
  This results in a reliable tripping current range.
- Mains type and line voltage:
  This results in maximum tripping time.
- RCD variant (standard or selective):
  This results in maximum tripping time.

Note on RCCBs:

Testing of RCCBs is conducted in accordance with the specifications set forth in DIN EN 61008-1 (VDE 0664-10) and
DIN EN IEC 61008-2-1 (VDE 0664-1).

Definitions of Requirements in the Standards

VDE 0100-600 (IEC 60364-6), which is included in all German standards collections for electricians, applies to measurements in electrical systems. It plainly states: “The effectiveness of the protective measure is substantiated when disconnection occurs no later than upon occurrence of rated differential current $I_{\Delta N}$.”

As a requirement for the measuring instrument manufacturer, DIN EN 61557-6 (VDE 0413-6) unmistakably specifies:
“The measuring instrument must be capable of substantiating the fact that the residual current which trips the residual current device (RCD) is less than or equal to rated residual current.”

Comment

For all electricians, this means that during required protective measures testing after system modifications or additions to the system, as well as after repairs or during the E-check conducted after measurement of touch voltage, the tripping test must be conducted no later than upon reaching a value of, depending upon the RCD, 10, 30, 100, 300 or 500 mA.

How does the electrician react in the event that these values are exceeded? The RCD is replaced!

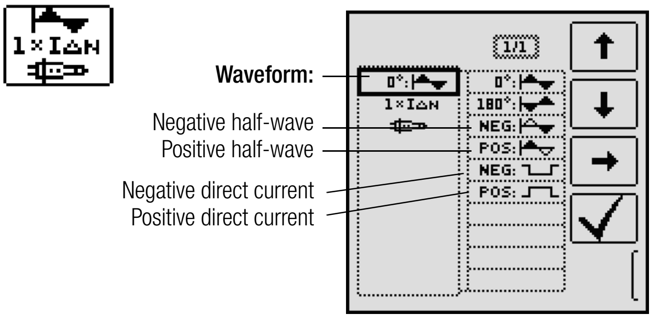
If it was relatively new, a complaint is submitted to the manufacturer. And in his lab the manufacturer determines: The RCD complies with the manufacturer’s standard and is OK.

A look at the VDE 0664-10/-20/-100/-200 manufacturer’s standard shows us why:

Type of Residual Current	Residual Current Waveform	Permissible Tripping Current Range
Sinusoidal alternating current		0.5 … 1 $I_{\Delta N}$
Pulsating direct current (positive or negative half-waves)		0.35 … 1.4 $I_{\Delta N}$
Phase angle controlled half-wave currents Phase angle of 90° el Phase angle of 135° el		0.25 … 1.4 $I_{\Delta N}$ 0.11 … 1.4 $I_{\Delta N}$
Pulsating direct current superimposed with 6 mA smooth, direct residual current		Max. 1.4 $I_{\Delta N}$ + 6 mA
Smooth direct current		0.5 … 2 $I_{\Delta N}$

Because the current waveform plays a significant role, the current waveform used by the test instrument is also important.

Set residual current type or waveform at the test instrument:



It’s important to be able to select and take advantage of the corresponding settings at one’s own test instrument.

The situation is similar for breaking times. The new VDE 0100-410 should also be included in the standards collection.
Depending upon mains type and line voltage, it specifies breaking times ranging from 0.1 to 5 seconds.

System	50 V < U_0 ≤ 120 V		120 V < U0 £ 230 V		230 V < U0 £ 400 V		U_0 > 400 V	
	AC	DC	AC	DC	AC	DC	AC	DC
TN	0.8 s		0.4 s	5 s	0.2 s	0.4 s	0.1 s	0.1 s
TT	0.3 s		0.2 s	0.4 s	0.07 s	0.2 s	0.04 s	0.1 s

RCDs usually interrupt more quickly, but in some cases they can take a bit longer. Once again, the ball is in the manufacturer’s court.

The following table is also included in VDE 0664:

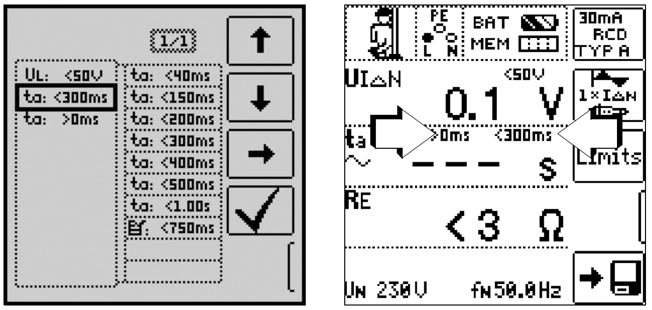
Design	Residual Current Type	Breaking Time at			
	Alternating residual current	1 × $I_{\Delta N}$	2 × $I_{\Delta N}$	5 × $I_{\Delta N}$	500 A
	Pulsating direct residual current	1.4 × $I_{\Delta N}$	2 × 1.4 × $I_{\Delta N}$	5 × 1.4 × $I_{\Delta N}$	500 A
	Smooth, direct residual current	2 × $I_{\Delta N}$	2 × 2 × $I_{\Delta N}$	5 × 2 × $I_{\Delta N}$	500 A
Standard (undelayed) or briefly delayed		300 ms	Max. 0.15 s	Max. 0.04 s	Max. 0.04 s
Selective		0.13 … 0.5 s	0.06 … 0.2 s	0.05 … 0.15 s	0.04 … 0.15 s

Two limit values are highly conspicuous:

Standard	max. 0.3 s
Selective	max. 0.5 s

All of the limit values are already included in good test instruments, or it’s possible to enter them directly and they’re displayed as well!

Select or set limit values at the test instrument:



UIΔN <50V 0.1 V

ta >0ms <300ms – – – s

RE < 3 Ω

UN 230V fN 50.0Hz

Tests for electrical systems include “visual inspection”, “testing” and “measurement”, and thus may only be conducted by experts with appropriate work experience.

In the final analysis, the values from VDE 0664 are technically binding.

25.3 Testing Electrical Machines per DIN EN 60204 – Applications, Limit Values

The PROFITEST PRIME AC test instrument has been developed for the testing of electrical machines and controllers. After a revision to the standard, measurement of loop impedance is now additionally required. Measurement of loop impedance, as well as other measurements required for the testing of electrical machines, can be performed with test instruments from the PROFITEST MASTER series.

Comparison of Tests Specified by the Standards

Testing per DIN EN 60204-1 (machines)	Testing per DIN EN 61557 (systems)	Measuring Function
Uninterrupted connection of a protective conductor	Part 4: Resistance of: – Ground conductor – Protective conductor – Equipotential bonding conductor	RLO
Loop Impedance	Part 3: Loop Impedance	ZL-PE
Insulation resistance	Part 2: Insulation resistance	RISO
Testing for dielectric strength	Part 14: Equipment for testing the safety of electrical equipment of machinery	—
Protection against residual voltage	Part 14: Equipment for testing the safety of electrical equipment of machinery	Ures
Function test	—	—

Uninterrupted connection of a protective conductor

Uninterrupted connection of a protective conductor system is tested here by using an alternating current of 0.2 to 10 A with a line frequency of 50 Hz.
(= low-resistance measurement) Testing must be conducted between the PE terminal and various points within the protective conductor system.

Loop Impedance Measurement

Loop impedance Z_{L-PE} is measured and short-circuit current I_{SC} is ascertained in order to determine if the breaking requirements for protective devices have been fulfilled (see section 13).

Insulation Resistance Measurement

All of the active conductors in the primary circuit are short-circuited at the machine (L and N, or L1, L2, L3 and N) and measured against PE (protective conductor). Controllers or machine components which are not laid out for these voltages (500 V DC) can be disconnected from the measuring circuit for the duration of the measurement. The measured value may not be any less than 1 MΩ. The test can be subdivided into separate segments.

Voltage Tests (with PROFITEST PRIME AC only)

The electrical equipment of the machine under test must withstand a test voltage of twice its own rated voltage value or 1000 V~ (whichever is greater) applied between the conductors of all circuits and the protective conductor system for a period of at least 1 second. The test voltage must have a frequency of 50 Hz, and must be generated by a transformer with a minimum power rating of 500 VA.

(Residual) Voltage Measurements

The EN 60204 standard specifies that after switching supply power off, residual voltage must drop to a value of 60 V or less within 5 seconds at all accessible, active components of a machine to which a voltage of greater than 60 V is applied during operation.
When conductors are exposed, residual voltage must drop to a value of less than or equal to 60 V within 1 second.

Function Test

The machine is operated with nominal voltage and tested for correct functioning, in particular with regard to safety functions.

Special Tests

- Pulse control mode for troubleshooting (with PROFITEST PRIME AC only)
- Protective conductor test with 25 A test current (with PROFITEST PRIME AC only)

Limit Values per DIN EN 60204-1

Measurement	Parameters	Cross-Section	Standard Value
Protective conductor measurement	Test duration		10 s
	Limit value Protective conductor resistance based on phase conductor cross-section and characteristics of the overvoltage protection device (calculated value)	1.5 mm^2 2.5 mm^2 4.0 mm^2 6.0 mm^2 10 mm^2 16 mm^2 25 mm^2 L (16 mm^2 PE) 35 mm^2 L (16 mm^2 PE) 50 mm^2 L (25 mm^2 PE) 70 mm^2 L (35 mm^2 PE) 95 mm^2 L (50 mm^2 PE) 120 mm^2 L (70 mm^2 PE)	500 mΩ 500 mΩ 500 mΩ 400 mΩ 300 mΩ 200 mΩ 200 mΩ 100 mΩ 100 mΩ 100 mΩ 050 mΩ 050 mΩ
Insulation resistance measurement	Nominal voltage		500 V DC
	Resistance limit value		≥ 1 MΩ
Leakage current measurement	Leakage current		2.0 mA
Protection against residual voltage	Discharge time after switching off supply power		5 s
	Discharge time after exposing conductors		1 s
Testing for dielectric strength	Test voltage		2 × U_N or 1 kV
	Test voltage frequency		50 Hz or 60 Hz
	Test duration		1 s

Overvoltage Protection Device Characteristics for Limit Value Selection for Protective Conductor Testing

Breaking Time, Characteristics	Available for Cross-Section
Fuse breaking time: 5 s	All cross-sections
Fuse breaking time: 0.4 s	1.5 through 16 sq. mm
Circuit breaker, characteristic B Ia = 5 × I_n - breaking time 0.1 s	1.5 through 16 sq. mm
Circuit breaker, characteristic C Ia = 10 ×I_n - breaking time 0.1 s	1.5 through 16 sq. mm
Adjustable circuit breaker Ia = 8 × I_n - breaking time: 0.1s	All cross-sections

25.4 Periodic Testing per DGUV V 3 (previously BGV A3) – Limit Values for Electrical Systems and Operating Equipment

Limit Values per EN 50678 / DIN EN 50699

Maximum Permissible Limit Values for Protective Conductor Resistance for Connector Cables with Lengths of up to 5 m

Test Standard	Test Current	Open-circuit voltage	R_{SL} Housing – Mains Plug
EN 50678 / DIN EN 50699	> 200 mA⎓	4 V < U_L < 24 V	0.3 Ω [1] + 0.1 Ω [2] for each additional 7.5 m

---

[1] This value may not exceed 1 Ω for permanently connected data processing systems (EN 50678 / DIN EN 50699).

[2] Total protective conductor resistance: max. 1 Ω

Minimum Permissible Limit Values for Insulation Resistance

Test Standard	Test Voltage	R_{ISO}			
		PC I	PC II	PC III	Heating
EN 50678 / DIN EN 50699	500 V	1 MΩ	2 MΩ	0.25 MΩ	0.3 MΩ *

* With activated heating elements (where heating power > 3.5 kW and R_{ISO} < 0.3 MΩ: leakage current measurement is required)

Maximum Permissible Limit Values for Leakage Current in mA

Test Standard	I_{PE}	I_C	I_{DI}
EN 50678 / DIN EN 50699	PC I: 3.5 1 mA/kW *	0.5	PC I: 3.5 1 mA/kW * PC II: 0.5

* For devices with heating power of greater than 3.5 kW

Note 1: Devices which are not equipped with accessible parts that are connected to the protective conductor, and which comply with requirements for housing leakage current and, if applicable, patient leakage current, e.g. computer equipment with shielded power pack

Note 2: Permanently connected devices with protective conductor

Note 3: Portable X-ray devices with mineral insulation

I_B Housing leakage current (probe or touch current)

I_{DI} Residual current

I_{SL} Protective conductor current

Maximum Permissible Limit Values for Equivalent Leakage Current in mA

Test Standard	I_{EL}
EN 50678 / DIN EN 50699	PC I: 3.5 1 mA/kW [1] PC II: 0.5

[1] For devices with heating power ≥ 3.5 kW
